## Revision History

<b>Current:</b> Revision 1.1, 2025-04-10	
<b>Previous:</b> Revision 1.0, 2024-04-16	
Page	Major changes since previous revision
27	<b>Table 6 MDIO Management Interface Signals:</b> Correct MDIO clock frequency.
55	<b>Section 3.7 GPIO Mapping:</b> Added section.
62	<b>Figure 10 LED Connection Options to Ground or Power Supply:</b> Updated figure.
63	<b>Figure 11 Connection of a Dual Color LED and Configuring Pin Strap Value:</b> Updated figure.
63	<b>Figure 12 Connection of a Single Color LED and Configuring Pin Strap Value:</b> Updated figure.
77	<b>Section 3.17 Switch Fabric Functional Description:</b> Switch Fabric Functional Description section moved to better add sub-sections covering Ethernet Bridging, VLANs, Multicast, Quality of Service, and Flow Classification.
141	<b>Section 5.2 PHY-specific Management Registers:</b> Removed LED3EN and LED3DA in <b>LED Control Register (Register 0.27)</b> .
275	<b>Figure 25 Timing Diagram for the Reset Sequence:</b> Updated figure with reset cycle.
290	<b>Table 64 JEDEC Thermal Resistance Package Parameter - Compact 2-R Model Network:</b> Updated table.

## Third-Party Trademark and Registered Trademark Declarations

ANSI®	“ANSI”, the ANSI logo, and numerous other identifiers containing “ANSI” are registered trademarks, service marks, and accreditation marks of the American National Standards Institute (ANSI).
ARC®	ARC is a registered trademark of Synopsys, Inc. in the U.S. and/or other countries.
Cisco®	Cisco is a registered trademark or trademark of Cisco Systems, Inc. and/or its affiliates in the United States and certain other countries. A list of other Cisco marks is available at <a href="https://www.cisco.com/c/en/us/about/legal/trademarks.html">https://www.cisco.com/c/en/us/about/legal/trademarks.html</a> .
IEEE®	“IEEE”, the IEEE logo, and other IEEE logos and titles are registered trademarks or service marks of The Institute of Electrical and Electronics Engineers, Incorporated.
IEEE 802.1™	IEEE 802.1 is a trademark of The Institute of Electrical and Electronics Engineers, Incorporated.
IEEE 802.3™	IEEE 802.3 is a trademark of The Institute of Electrical and Electronics Engineers, Incorporated.
ITU-T®	ITU-T is a registered trademark of the ITU, a specialized agency of the United Nations.
JEDEC®	JEDEC is a registered trademark of the JEDEC Solid State Technology Association.
Macronix®	Macronix, MXIC, MXIC logo, XtraROM, NBit and Macronix NBit are trademarks of Macronix International Co., Ltd.
Microsoft®	Microsoft is a registered trademark of Microsoft Corporation in the United States and/or other countries.
NXP®	NXP is a trademark of NXP B.V.
Philips®	The PHILIPS wordmark and shield emblem are registered trademarks of Koninklijke Philips N.V.
Winbond®	Winbond is a registered trademark of Winbond Electronics Corporation.

All other trademarks or registered trademarks are the property of their respective holders/owners.

## Preface

This Data Sheet describes the features and system architecture of the Ethernet Switch MxL86252I, which is a 7-Port Ethernet Switch with Five 2.5 Gigabit PHYs and Two 10 Gigabit SerDes. In addition, the web-smart switch is capable of hosting a web-server and supports the industrial temperature range.

## Document Conventions

In the interest of brevity, this document uses short names to represent full product names.

**MxL86252I**                      Ethernet Switch MxL86252I

## Document Information

This document's identifying information is:

### Document Reference (Citation) Name

Ethernet Switch MxL86252I Data Sheet Revision 1.1

### File Name

621180\_MxL86252I\_DS\_Rev1.1.pdf

## Organization of this Document

- **Chapter 1, Product Overview**  
This chapter provides an overview of the MxL86252I.
- **Chapter 2, External Signals**  
This chapter provides a pinout of the MxL86252I device package.
- **Chapter 3, Functional Description**  
This chapter provides the functional description for the MxL86252I.
- **Chapter 4, MDIO and MMD Register Interface Description**  
This chapter describes the MDIO and MMD registers available to support the MxL86252I feature set.
- **Chapter 5, PHY MDIO Registers Detailed Description**  
This chapter describes the fields and reset values of the MDIO registers.
- **Chapter 6, PHY MMD Registers Detailed Description**  
This chapter describes the fields and reset values of the MMD registers.
- **Chapter 7, Electrical Characteristics**  
This chapter provides the electrical characteristics for the MxL86252I.
- **Chapter 8, Package Outline**  
This chapter provides a package outline for the MxL86252I.
- **Chapter 9, Product Ordering Information**  
This chapter provides the product ordering details for the MxL86252I.
- **Standards References**

## 1 Product Overview

The MxL86252I device is a highly integrated, low power, non-blocking multi-port Ethernet Switch with two 10G Ethernet SerDes interfaces. It offers a cost-optimized solution well-suited for routers, switches, and home gateways. The MxL86252I has five integrated Ethernet BASE-T PHYs which support four data rates: 2500, 1000, 100, and 10 Mbps.

On the Ethernet Twisted Pair Interface (TPI), the MxL86252I is compliant with the standards from IEEE 802.3 referenced in [6]:

- 2.5GBASE-T (IEEE 802.3 Clause 126, NBASE-T)
- 1000BASE-T (IEEE 802.3 Clause 40)
- 100BASE-TX (IEEE 802.3 Clause 25)
- 10BASE-Te (IEEE 802.3 Clause 14)

This interface supports the Energy-Efficient Ethernet (EEE) feature to reduce idle mode power consumption. Power saving at the system level is also possible with the wake-on-LAN feature. A low-EMI line driver with integrated termination facilitates the PCB design.

The two SerDes ports of the MxL86252I support up to 10 Gbps USXGMII [11] or XFI interface to connect to an external PHY, SFP, or the MAC of an external chip.

With reference to the Open System Interconnection (OSI) model, the MxL86252I implements five layer 1 physical media access devices, a layer 2 switch, and an MDIO management interface.

The MxL86252I provides two Ethernet SerDes data interfaces, each configurable as single port 10G/5G/2.5G-USXGMII, SGMII+, SGMII, XFI/SFI/10G-KR, 5G-KR, 2500BASE-X, and 1000BASE-X to connect these options:

- SoC with single-port 10G USXGMII/XFI interface using an MDIO slave interface for management
- SFP cage with single-port 10G XFI interface using an I<sup>2</sup>C master interface for management
- 10G PHY with single-port 10G USXGMII/XFI interface using an MDIO master interface for management

The MxL86252I supports the Precision Time Protocol (PTP) and Synchronous Ethernet (SyncE).

Up to 1 MB embedded packet storage SRAM is integrated and 10 kB jumbo frames are supported. The MxL86252I integrates a 1K entry VLAN table for 802.1Q port-based, tag-based, and protocol-based VLAN operation. It also supports double VLAN tagging, insertion, removal, and translation. The MxL86252I features 16K VLAN-aware MAC addresses with 4-way hashing algorithm for address searching, auto-learning, and auto-aging.

A programmable packet parser and a powerful classification engine allow future-proof designs that enable various data traffic types. The MxL86252I supports IPv4 and IPv6 multicast forwarding, including IGMPv1/IGMPv2/IGMPv3 and MLDv1/MLDv2 snooping.

The MxL86252I features an advanced QoS architecture which prioritizes switch traffic for different classes of applications based on multiple fields of the packet. Multiple queues per port with strict or deficit weighted round robin scheduling and rate shaping are supported. It is possible to re-mark VLAN PCP and IP DSCP. The MxL86252I also supports Precise Time Stamping (PTS) indication according to IEEE 1588v2 and IEEE 802.1AS.

An ARC 400 MHz CPU is integrated in the MxL86252I to offer customer web management functions, including HTTP/HTTPS, secure boot, SSL, and dual image for firmware upgrade via webGUI.

The MxL86252I supports a standard MDIO management interface as defined in IEEE 802.3 Clause 22 and Clause 45 [6]. The MDIO serial interface is operable with a clock running up to 25 MHz. It allows a management entity (the external chip implementing the MAC) to access standard MDIO/MMD registers to control the MxL86252I's behavior, or to read the link status. The MxL86252I is also configurable via pin strapping.

The MxL86252I is capable of driving up to 15 LEDs (three per BASE-T port). Each LED is independently programmable to indicate the link speed and traffic activities. Several indication schemes are selectable.

External supplies of 0.85 V, 1.2 V, 1.8 V, and 3.3 V are required to power the MxL86252I device.

The MxL86252I uses a ball grid array package (type BGA 18 x18 matrix, size 12 mm x 12 mm).

## 1.1 Features

This section provides an overview of the features supported by the MxL86252I.

### Communication Interfaces

- The five Ethernet BASE-T interfaces support:
  - Ethernet modes and standards  
2.5GBASE-T (IEEE 802.3, NBASE-T), 1000BASE-T (IEEE 802.3), 100BASE-TX (IEEE 802.3), and 10BASE-Te (IEEE 802.3)
  - Ethernet twisted pair copper cable of category Cat5 or higher
  - Low EMI voltage mode line driver with integrated termination resistors
  - Transformerless Ethernet for backplane applications
  - Auto-Negotiation (ANEG) with extended next page support
  - Auto-MDIX and polarity correction
  - Auto-Downspeed (ADS)
  - 100BASE-TX EEE, 1000BASE-T EEE, 2.5GBASE-T EEE, and power down mode
  - Cable diagnostics: cable open/short detection and cable length estimation
  - Wake-on-LAN (WoL)
  - Precision Time Stamping (PTS), implementing standard IEEE 1588v2
  - Jumbo frames of up to 10 kB
- Two Ethernet SerDes interfaces, where each interface supports:
  - 10G/5G/2.5G-USXGMII, SGMII+, SGMII, XFI/SFI, 10G-KR, 5G-KR, 2500BASE-X, and 1000BASE-X
  - IEEE 802.3-2012, IEEE 10GBASE-KR (10.3125 Gbps) Physical Layer electrical specifications
  - The PHY complies with all of the required features specified in the Cisco USXGMII Multiport Copper PHY Specification [\[12\]](#) and Cisco USXGMII Single-port Copper PHY Specification [\[13\]](#)
  - Back channel equalization, auto-negotiation, Forward Error Correction (FEC)
  - Clock and Data Recovery (CDR), no clock forwarding required
  - Clause 73 backplane auto-negotiation
  - Clause 37 auto-negotiation in SGMII and USXGMII modes
  - Clause 72 for 10G-base (K)R training
- The management interface supports the communication between the Station Manager (STA, per IEEE 802.3) and the MxL86252I using:
  - A Management Data Input/Output (MDIO) slave interface providing access to the standard registers in the MMD
  - An MDIO interface clock of up to 25 MHz
  - 3 MDIO message frame types as described in IEEE 802.3: Clause 22, Clause 22 Extended, and Clause 45 [\[6\]](#)
- The MDIO master interface controlling external devices supports:
  - Both clause 22 and clause 45
  - Automatic scanning of link status change of external devices. The MDIO addresses of the external devices are programmable.
  - The MxL86252I is able to access the external devices via an MDIO interface.
  - An MDIO interface clock of up to 50 MHz
- The Quad SPI master interface connecting to serial external Quad-SPI flash memory supports:
  - Programmable interface clock: maximum 101 MHz
  - Internal firmware code access from external Quad-SPI flash memory
  - Write access to the Quad-SPI flash memory
  - Different Quad-SPI flash memory sizes up to 512 MB
  - Secure firmware upgrade of the flash memory
- Two instances of the I<sup>2</sup>C master interface controlling external devices support these speed modes:
  - Standard mode (<100 Kbps)
  - Fast mode (<400 Kbps)

- Fast mode plus (<1000 Kbps)
- High speed mode (<3.4 Mbps)
- The JTAG interface supports:
  - Boundary scan
  - Test and debug interface
  - Shared pins with GPIO functions
- The LED interface supports:
  - Programmable LED
  - Up to three LEDs per BASE-T port
  - Single and dual color LEDs
  - Connection of LED to ground or 3.3 V
  - Several LED indication schemes (link/activity, duplex/collision, and link speed)
  - Configuration of LED indication via MDIO registers
  - Control of LED brightness via software driver API
  - Alternative configuration of LED pins as GPIO for custom indication
- Supports two external interrupts:
  - Configurable as output to an external controller
  - Configurable as input from external device(s)
  - Configurable edge, level, and polarity

### **On-Chip Web-Smart Processor (WSP)**

- An ARC EM4 subsystem:
  - Integrated micro-controller
  - 64 KB of instruction cache
  - Host a web-server
  - HTTP/HTTPS
  - Secure Boot
  - SSL
  - Dual image for firmware upgrade in smart mode

### **Clocking, Timing, and Time Stamping Features**

- The input reference clock options are:
  - 25 MHz crystal operation
  - 25 MHz direct from an external oscillator
  - An external CML/LVPECL reference clock operating at 50 MHz
- The output reference clock options are two pairs of differential clocks at 50 MHz, 156.25 MHz, and the same frequency as the input reference clock.
- SyncE, implementing standard ITU-T G.8262/Y.1362
- PTP, according to standard IEEE 1588v2
- Four general purpose clock pins GPC0, GPC1, GPC2, and GPC3 shared with GPIO for several usage options, configurable by API:
  - To input or output the Synchronous Ethernet reference clock SyncE: 2.048 MHz, 1.544 MHz
  - To input or output the precise time stamping signals (PTP)
  - To output the pulse per second signal (PPS)

### **Ethernet MACs**

- Five Ethernet MACs for each BASE-T port, complying with IEEE 802.3:
  - Quad rate, that is, 10 Mbps, 100 Mbps, 1000 Mbps, or 2.5 Gbps operation speed for internal PHY
  - Half-duplex operation mode for 10 Mbps and 100 Mbps
  - Full-duplex operation mode for all speeds

- Two Ethernet MACs for each Ethernet SerDes interface, complying with IEEE 802.3:
  - Multiple rate at 10 Mbps, 100 Mbps, 1000 Mbps, 2.5 Gbps, 5 Gbps, or 10 Gbps operation speed for external PHY
  - Full-duplex operation mode for all speeds
- Enhanced frame size support (Jumbo frames, programmable limit up to 10 Kbyte)
- 802.3X flow control (pause frame) and 802.1Qbb flow control (PFC pause frame) in full-duplex mode. Backpressure (forced collisions) in half-duplex mode.
- Frame padding on egress traffic
- Minimum and maximum frame length check
- Frame Check Sequence (FCS) verification and stripping
- FCS generation and insertion/replacement
- Low Power Idle (LPI) mode as defined by IEEE 802.3 EEE

### **Pseudo MAC**

- Carrying traffic to/from the integrated CPU
- FCS stripping, replacement, or insertion on the traffic to the integrated CPU
- FCS verification and/or stripping for traffic from the integrated CPU

### **Packet Processing**

- L2 bridging
  - 16K entry VLAN-aware MAC address table
  - Shared and independent VLAN learning
  - Layer 2 security: IEEE 802.1X port authentication, MAC address filtering, port locking and spoofing detection, MAC address limiting, and broadcast storm control
  - Multiple spanning tree protocol
  - MAC in MAC tunneling (802.1ah), 256 tunnels
- L3 multicast forwarding at virtual-interface level
  - 1K entry VLAN aware IP multicast group table
  - Any Source Multicast (ASM) and Source Specific Multicast (SSM)
  - IPv4 IGMPv1/IGMPv2/IGMPv3 and IPv6 MLDv1/MLDv2 with software/firmware involvement
- VLAN classification
  - 802.1Q, 802.1Q QinQ, 802.1Qbg
  - 1K entry VLAN filtering
  - 1K entry extended VLAN tagging operation with sophisticated single tag and double tag VLAN mapping and translation
  - Private VLAN
- Traffic flow classification (ACL)
  - Programmable packet parsing
  - 512 entry traffic flow classification table
  - 32 concurrent keys with 1k bits in each entry
    - Support bit mask and range for some of the keys. Keys include the source port information, packet length, and multiple L2/L3/L4/L4+ packet fields.
  - Multiple concurrent policy actions in each entry
    - Destination port(s) assignment (including discard option), port filtering, traffic class assignment, traffic meter assignment, extended VLAN tagging operation assignment, MAC in MAC tunnel assignment, flow counter assignment, OAM handling assignment, cross VLAN policy, cross state policy, color assignment, Link Aggregation Group (LAG) assignment, PTP event packet policy, L2 MAC address learning policy, and interrupt policy
- Advanced QoS
  - Up to 1 MB packet buffer
  - Total 128 priority queues, up to eight priority queues per port

- Flexible traffic class assignment
- Flexible priority marking and re-marking
- Flexible color marking and re-marking
- Traffic metering on ingress and/or egress traffic
  - srTCM and trTCM, 128 meters
- Per port and per queue shaping
- Strict priority and DWRR scheduling
- Operation, Maintenance, and Management
  - Packets and bytes counters per MAC, per port, per virtual interface, and per traffic flow
  - Packet mirroring (ingress and egress mirroring to a designated port)
  - Loop detection support with software/firmware involvement
  - Loop-back support
  - IEEE 802.1ag and ITU-T Y.1731 Ethernet OAM delay and loss measurement hardware support
  - LAG support
    - 32 groups, up to 64 ports or virtual interfaces in a LAG

### **1588 Time Stamp**

- Ethernet packet time stamping as IEEE 1588 (v1 and v2) and IEEE 802.1AS-REV
- Ordinary clock, boundary clock, end-to-end transparent clock and peer-to-peer transparent clock modes support with software/firmware involvement
- PTP over Ethernet and PTP over UDP over IPv4/IPv6
- It is possible to adjust time and frequency of the system reference time.
- Auxiliary time stamp snapshot for the time synchronization with other chips via the GPIO type signal
- 1 pulse per second (PPS) output programmable for start, stop, pulse width, and interval
- 1-step time stamping in Tx direction
- 2-step time stamp (16-entries in FIFO per Ethernet port) in Tx direction

### **Synchronous Ethernet (SyncE)**

- Synchronous Ethernet according to ITU-T G.8262/Y.1362.
- Supports EEC-1 (2.048 MHz), EEC-2 (1.544 MHz), and 8 kHz reference clock input.
- Supports regeneration of these reference clocks as output.

### **Other Features**

- Temperature Sensor (warning, interrupt, reset and auto-downspeed)

### **Power Supply**

- 3.3 V, 1.8 V, 1.2 V, and 0.85 V external power sources

## **1.2 Applications**

This section lists the supported modes of operation.

- Smart mode, whereby running a web-server is supported, and is configured via a web interface [\[3\]](#). Pre-configuration of the features in the Flash Configuration Area (FCA) is also supported. The FCA is an area in the flash memory which can be used to realize a limited static functionality set that differs from the default configuration. The FCA is described in [\[2\]](#). This mode is the main application (web-smart) of the MxL86252I. Refer to [\[3\]](#) for information on using the MaxLinear-provided web-server. Refer to [\[4\]](#) for information on customizing the web-server.
- Unmanaged mode, whereby no reconfiguration during runtime is necessary. MxL86252I-based devices work out of the box with their basic or default feature set. FCA must be used to change the default configuration.

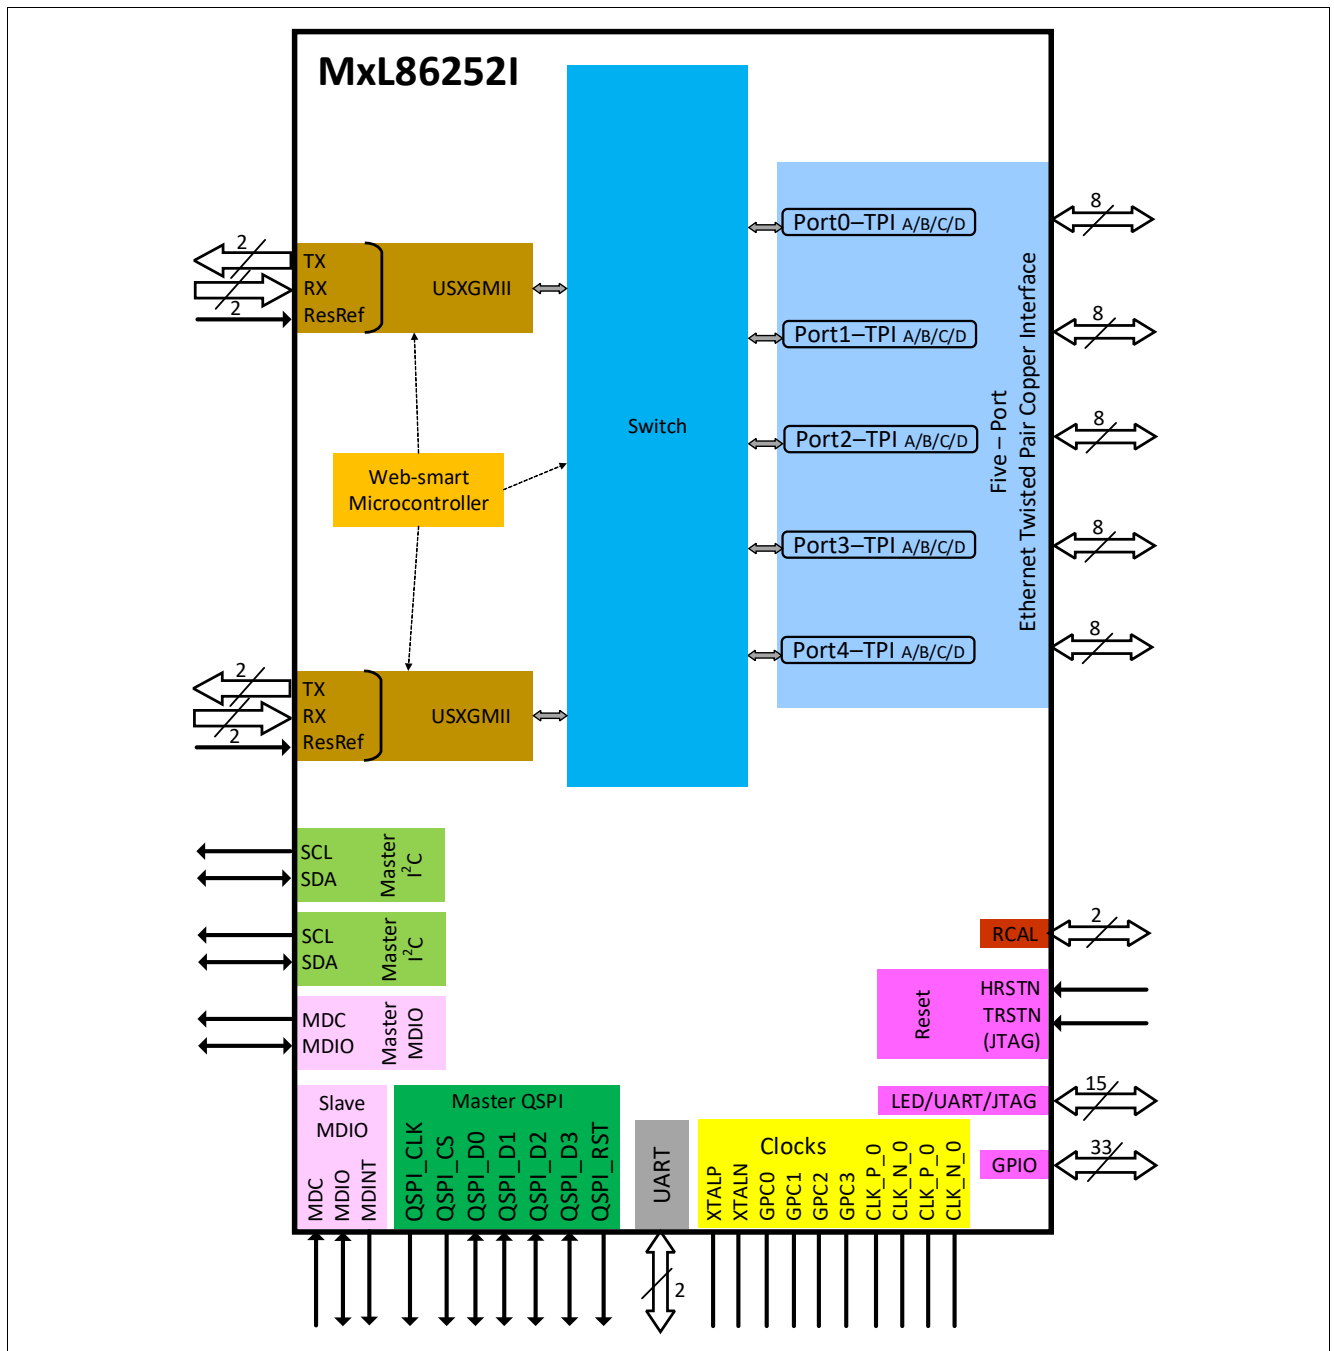

This mode is also supported in Ethernet Switch MxL86252L. Refer to [\[1\]](#) for more information about the capabilities of the MxL86252L.

- MDIO-managed mode, whereby the configuration of a lot of features is offered by means of an API via the slave MDIO interface. Contact MaxLinear for access to the API documentation. Pre-configuration of the features in the FCA is also supported. This mode is also supported in Ethernet Switch MxL86252L. Refer to [\[1\]](#) for more information about the capabilities of the MxL86252L.

### 1.3 Block Diagram

**Figure 1** shows the block diagram of the MxL86252I. The main interfaces are:

- Data interface to a SFP/PHY/SoC/MAC processor, using USXGMII/XFI
- Slave control interface driven by a SoC processor, using MDIO slave
- Master control interface driven to a PHY, using MDIO master
- Master control interface driven to a SFP, using I<sup>2</sup>C master
- Interrupt signal MDINT allowing the MxL86252I to notify the external processor about a change of status
- LED control
- Twisted pair interfaces (TPI)
- Master Quad Serial Peripheral Interface (QSPI) interface

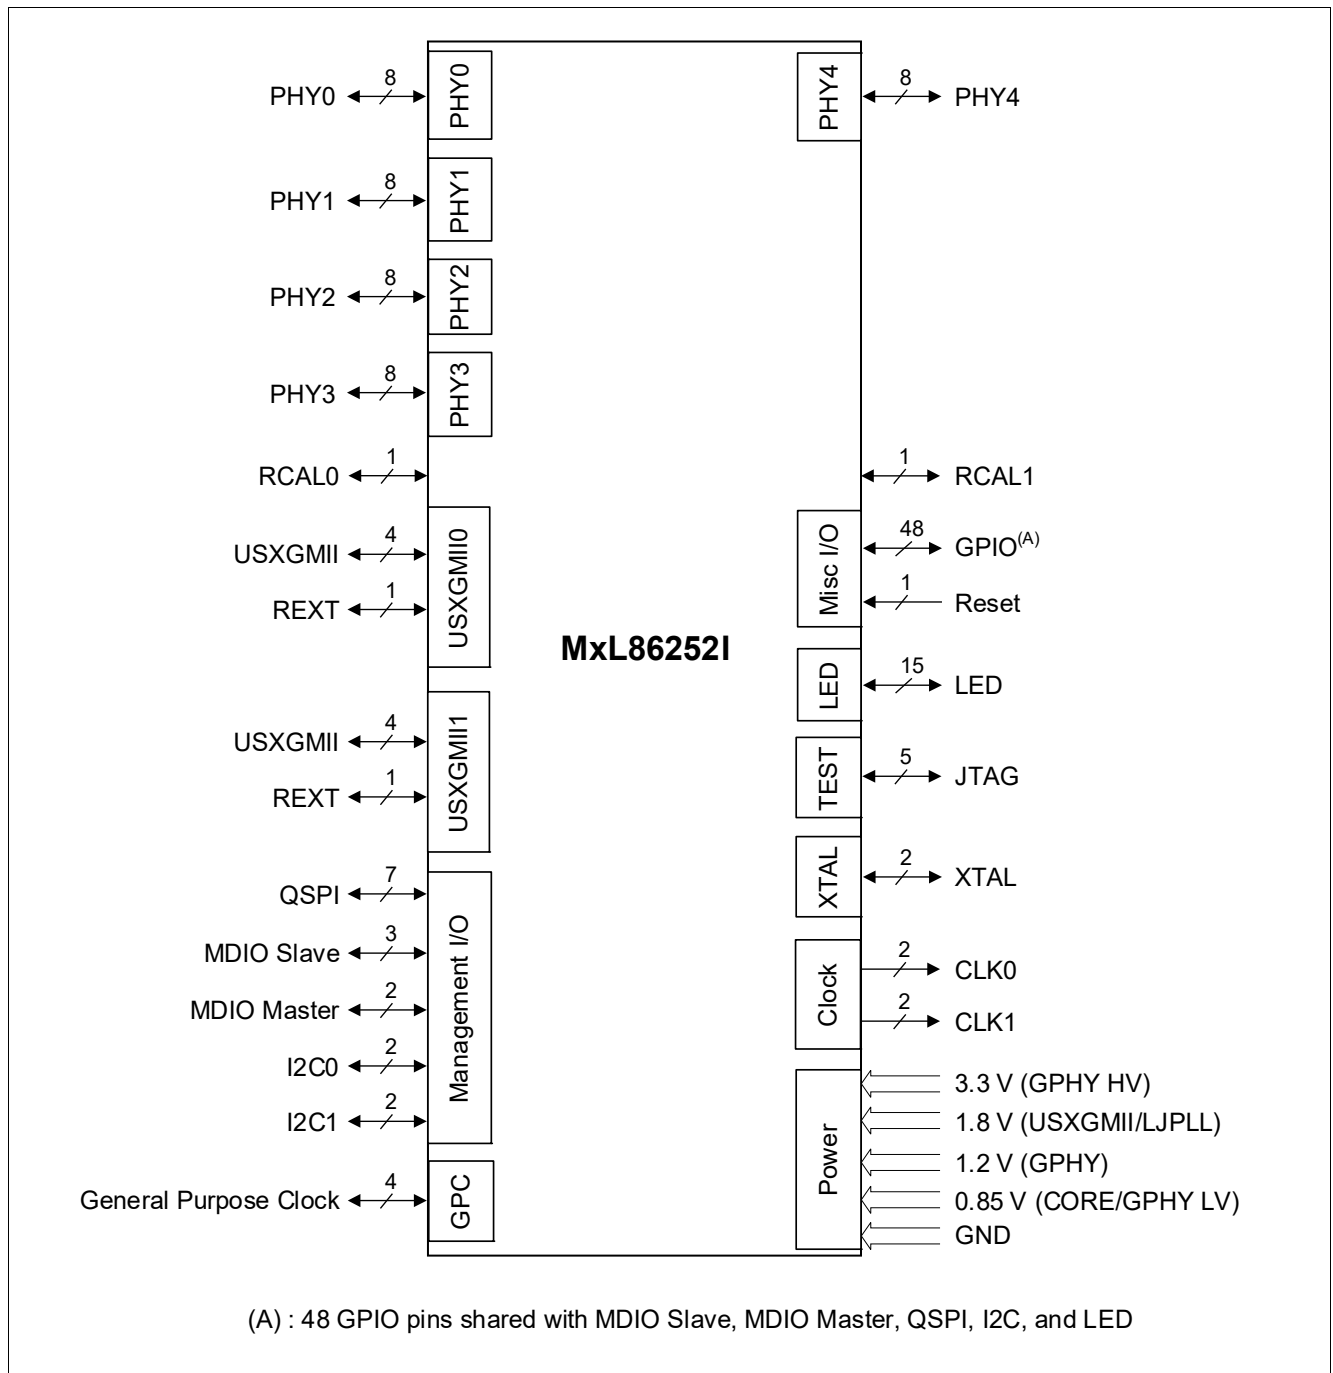

**Figure 1 MxL86252I Block Diagram**

## 2 External Signals

This chapter describes the signal mapping to the package.

### 2.1 Logic Symbol

**Figure 2** gives an overview of the device's external interfaces.

**Figure 2 MxL86252I External Signal Overview**

## 2.2 External Signal Description

This section provides the ball diagram, abbreviations for pin types and buffer types, and the table of input and output signals.

### 2.2.1 Ball Diagram

**Figure 3** shows the ball diagram. **Table 1** lists the ball diagram color codes.

**Table 1 Ball Diagram Color Codes**

Color	Description
White	Unpopulated Balls
Red	Power
Light Red	USXGMII Power
Orange	MDIO, I <sup>2</sup> C Signals
Grey	Ground
Blue	TPI-related Signals
Pink	QSPI, Reset Signals
Yellow	USXGMI Signals
Light Green	Clock, GPIO Signals
Light Blue	LED, JTAG Signals
White	NC

## 2.2.2 Abbreviations

**Table 2** and **Table 3** summarize the abbreviations used in the signal tables.

**Table 2 Abbreviations for Pin Type**

Abbreviations	Description
I	Input-only, digital levels
O	Output-only, digital levels
I/O	Bidirectional input/output signal, digital levels
Prg	Bidirectional pin, programmable to operate either as input or output, digital levels
AI	Input-only, analog levels
AO	Output-only, analog levels
AI/AO	Bidirectional, analog levels
PWR	Power
GND	Ground

**Table 3 Abbreviations for Buffer Type**

Abbreviations	Description
A	Analog characteristics, see the AC/DC specification for more information.
Prg	Programmable (open-drain/push-pull, pull-up/pull-down characteristic are programmable)
PU	Pull up (internal, weak)

## 2.2.3 Input/Output Signals

**Table 4** to **Table 15** provide a detailed description of all the pins.

### 2.2.3.1 Ethernet Twisted Pair Interface

Unused TPI signals must be unconnected.

**Table 4 Ethernet Twisted Pair Interface Signals**

Ball No.	Name	Pin Type	Buffer Type	Function
<b>Ethernet Port Twisted Pair Interface</b>				
A15	TPAP_0	AI/AO	A	<b>Port 0 Transmit/Receive Positive/Negative</b>

<b>Ethernet Port Test Point</b>				
D11	RCAL_0	AI/AO	A	<b>Test Point for GPHY Ethernet Ports 0 to 3</b> Test point, do not connect.
R11	RCAL_1	AI/AO	A	<b>Test Point for GPHY Ethernet Ports 4</b> Test point, do not connect.

### 2.2.3.2 USXGMII Interface

The balls listed in [Table 5](#) also apply for XFI and USXGMII.

**Table 5 USXGMII Interface Signals**

Ball No.	Name	Pin Type	Buffer Type	Function
B17	URXP_0	AI	A	<b>Differential USXGMII 0 Data Input Pair</b> These are the negative and positive signals of the differential input pair of the USXGMII SerDes interface. Due to the integrated CDR, no external transmission peer source-synchronous clock is required for USXGMII. These pins must be AC-coupled.
A17	URXM_0	AI	A	
C18	UTXP_0	AO	A	<b>Differential USXGMII 0 Data Output Pair</b> These are the negative and positive signals of the differential output pair of the USXGMII SerDes interface. Due to the integrated CDR, no external transmission peer source-synchronous clock is required for USXGMII. These pins must be AC-coupled.
C17	UTXM_0	AO	A	
B16	URESREF_0	AI/AO	A	<b>External USXGMII Tuning Resistor 0</b> Attach a 200 $\Omega$ ( $\pm 1\%$ ) resistor-to-ground on the board.
U17	URXP_1	AI	A	<b>Differential USXGMII 1 Data Input Pair</b> These are the negative and positive signals of of the differential input pair of the USXGMII SerDes interface. Due to the integrated CDR, no external transmission peer source-synchronous clock is required for USXGMII. These pins must be AC-coupled.
V17	URXM_1	AI	A	
T18	UTXP_1	AO	A	<b>Differential USXGMII 1 Data Output Pair</b> These are the negative and positive signals of the differential output pair of the USXGMII SerDes interface. Due to the integrated CDR, no external transmission peer source-synchronous clock is required for USXGMII. These pins must be AC-coupled.
T17	UTXM_1	AO	A	
U16	URESREF_1	AI/AO	A	<b>External USXGMII Tuning Resistor 1</b> Attach a 200 $\Omega$ ( $\pm 1\%$ ) resistor-to-ground on the board.

### 2.2.3.3 MDIO Interface

**Table 6 MDIO Management Interface Signals**

Ball No.	Name	Pin Type	Buffer Type	Function
MDIO Slave Interface				
G16	MDINT	O	Prg	<b>MDIO Interrupt from Any GPHY</b> The interrupt interrupts an external block such as a higher-level management entity or a device controller of an SoC, on detection of certain events and states inside the GPHY device. Voltage Domain: 1.8 V / 3.3 V
	GPIO4	Prg		<b>General Purpose IO 4</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 1.8 V / 3.3 V
K17	MDC_S	I	Prg	<b>MDIO Slave Clock</b> The external controller provides the serial clock of up to 25 MHz on this input. Voltage Domain: 1.8 V / 3.3 V
	GPIO5	Prg		<b>General Purpose IO 5</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 1.8 V / 3.3 V
K16	MDIO_S	I/O	Prg	<b>MDIO Slave Data Input/Output</b> The external controller uses this signal to address internal registers and to transfer data to and from the internal registers. Voltage Domain: 1.8 V / 3.3 V
	GPIO6	Prg		<b>General Purpose IO 6</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 1.8 V / 3.3 V
MDIO Master Interface				
L18	MDC_M	O	Prg	<b>MDIO Master Clock</b> The device provides the serial clock of up to 50 MHz on this output. Voltage Domain: 1.8 V / 3.3 V
	GPIO7	Prg		<b>General Purpose IO 7</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 1.8 V / 3.3 V

**Table 6 MDIO Management Interface Signals (cont'd)**

Ball No.	Name	Pin Type	Buffer Type	Function
L17	MDIO_M	I/O	Prg	<b>MDIO Master Data Input/Output</b> The device uses this signal to address external registers and to transfer data to and from the external registers. Voltage Domain: 1.8 V / 3.3 V
	GPIO8	Prg		<b>General Purpose IO 8</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 1.8 V / 3.3 V

## 2.2.3.4 QSPI Interface

**Table 7 QSPI Management Interface Signals**

Ball No.	Name	Pin Type	Buffer Type	Function
R17	<b>QSPI_D0</b>	I/O	Prg	<b>QSPI Data 0</b> QSPI interface data 0 Voltage Domain: 3.3 V
	GPIO9	Prg		<b>General Purpose IO 9</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
R16	<b>QSPI_D1</b>	I/O	Prg	<b>QSPI Data 1</b> QSPI interface data 1 Voltage Domain: 3.3 V
	GPIO10	Prg		<b>General Purpose IO 10</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
P16	<b>QSPI_D2</b>	I/O	Prg	<b>QSPI Data 2</b> QSPI interface data 2 Voltage Domain: 3.3 V
	GPIO11	Prg		<b>General Purpose IO 11</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
P17	<b>QSPI_D3</b>	I/O	Prg	<b>QSPI Data 3</b> QSPI interface data 3 Voltage Domain: 3.3 V
	GPIO12	Prg		<b>General Purpose IO 12</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
M15	<b>QSPI_CLK</b>	O	Prg	<b>QSPI Clock</b> QSPI interface clock output Voltage Domain: 3.3 V
	GPIO13	Prg		<b>General Purpose IO 13</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V

**Table 7      QSPI Management Interface Signals (cont'd)**

Ball No.	Name	Pin Type	Buffer Type	Function
N15	<b>QSPI_CS</b>	O	Prg	<b>QSPI Chip Select</b> QSPI interface chip select Voltage Domain: 3.3 V
	GPIO14	Prg		<b>General Purpose IO 14</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
L15	<b>QSPI_RST</b>	O	Prg	<b>QSPI Reset</b> QSPI Reset Voltage Domain: 3.3 V
	GPIO15	Prg		<b>General Purpose IO 15</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V

## 2.2.3.5 I<sup>2</sup>C Interface

**Table 8 I<sup>2</sup>C Management Interface Signals**

Ball No.	Name	Pin Type	Buffer Type	Function
F18	<b>I2C_SCL_0</b>	O	Prg	<b>I<sup>2</sup>C 0 Clock Output</b> I <sup>2</sup> C 0 interface clock output Voltage Domain: 3.3 V
	GPIO16	Prg		<b>General Purpose IO 16</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
F17	<b>I2C_SDA_0</b>	I/O	Prg	<b>I<sup>2</sup>C 0 Data</b> I <sup>2</sup> C 0 interface data Voltage Domain: 3.3 V
	GPIO17	Prg		<b>General Purpose IO 17</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
M17	<b>I2C_SCL_1</b>	O	Prg	<b>I<sup>2</sup>C 1 Clock Output</b> I <sup>2</sup> C 1 interface clock output Voltage Domain: 3.3 V
	GPIO18	Prg		<b>General Purpose IO 18</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
M16	<b>I2C_SDA_1</b>	I/O	Prg	<b>I<sup>2</sup>C 1 Data</b> I <sup>2</sup> C 1 interface data Voltage Domain: 3.3 V
	GPIO19	Prg		<b>General Purpose IO 19</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V

## 2.2.3.6 Reset Interface

Table 9 Reset Signals

Ball No.	Name	Pin Type	Buffer Type	Function
E4	HRSTN	I	PU	<b>Hardware Reset</b> Asynchronous active low device reset Voltage Domain: 3.3 V

### 2.2.3.7 LED/UART/JTAG Interface

**Table 10 LED and Debug Interface Signals**

Ball No.	Name	Pin Type	Buffer Type	Function
<b>LED Signals</b>				
E1	<b>PHYLED1_0</b>	I/O		<b>GPHY LED1 for Port 0</b> LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO20	Prg	Prg	<b>General Purpose IO 20</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	FW_UTXD	O		<b>Firmware UART Data Output</b> Firmware UART interface data output Voltage Domain: 3.3 V
E2	<b>PHYLED2_0</b>	I/O		<b>GPHY LED2 for Port 0</b> LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO21	Prg	Prg	<b>General Purpose IO 21</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	FW_URXD	I		<b>Firmware UART Data Input</b> Firmware UART interface data input Voltage Domain: 3.3 V
E3	<b>PHYLED3_0</b>	I/O		<b>GPHY LED3 for Port 0</b> LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO22	Prg	Prg	<b>General Purpose IO 22</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
F2	<b>PHYLED1_1</b>	I/O		<b>GPHY LED1 for Port 1</b> LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO23	Prg	Prg	<b>General Purpose IO 23</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	FW_UTXD	O		<b>Firmware UART Data Output</b> Firmware UART interface data output Voltage Domain: 3.3 V

**Table 10 LED and Debug Interface Signals (cont'd)**

Ball No.	Name	Pin Type	Buffer Type	Function
F3	<b>PHYLED2_1</b>	I/O		<b>GPHY LED2 for Port 1</b> LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO24	Prg	Prg	<b>General Purpose IO 24</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
G1	<b>PHYLED3_1</b>	I/O		<b>GPHY LED3 for Port 1</b> LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO25	Prg	Prg	<b>General Purpose IO 25</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
G2	<b>PHYLED1_2</b>	I/O		<b>GPHY LED1 for Port 2</b> LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO26	Prg	Prg	<b>General Purpose IO 26</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	TDI	I		<b>JTAG Serial Test Data Input</b> Voltage Domain: 3.3 V <i>Note: No external pull-up required.</i>
	FW_UTXD	O		<b>Firmware UART Data Output</b> Firmware UART interface data output Voltage Domain: 3.3 V
H2	<b>PHYLED2_2</b>	I/O		<b>GPHY LED2 for Port 2</b> LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO27	Prg	Prg	<b>General Purpose IO 27</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	TMS	I		<b>JTAG Test Mode Select</b> Voltage Domain: 3.3 V <i>Note: No external pull-up required.</i>
G3	<b>PHYLED3_2</b>	I/O		<b>GPHY LED3 for Port 2</b> LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO28	Prg	Prg	<b>General Purpose IO 28</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V

**Table 10 LED and Debug Interface Signals (cont'd)**

Ball No.	Name	Pin Type	Buffer Type	Function
J1	<b>PHYLED1_3</b>	I/O		<b>GPHY LED1 for Port 3</b> LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO29	Prg	Prg	<b>General Purpose IO 29</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	TCK	I		<b>JTAG Test Clock</b> The signals TDI, TDO, and TMS are synchronous, subject to this JTAG test clock. Voltage Domain: 3.3 V
	FW_UTXD	O		<b>Firmware UART Data Output</b> Firmware UART interface data output Voltage Domain: 3.3 V
J2	<b>PHYLED2_3</b>	I/O		<b>GPHY LED2 for Port 3</b> LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO30	Prg	Prg	<b>General Purpose IO 30</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	TDO	I/O		<b>JTAG Serial Test Data Output</b> JTAG test data output. Voltage Domain: 3.3 V <i>Note: No external pull-up required.</i>
H3	<b>PHYLED3_3</b>	I/O		<b>GPHY LED3 for Port 3</b> LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO31	Prg	Prg	<b>General Purpose IO 31</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
J3	<b>PHYLED1_4</b>	I/O		<b>GPHY LED1 for Port 4</b> LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO32	Prg	Prg	<b>General Purpose IO 32</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	FW_UTXD	O		<b>Firmware UART Data Output</b> Firmware UART interface data output Voltage Domain: 3.3 V

**Table 10 LED and Debug Interface Signals (cont'd)**

Ball No.	Name	Pin Type	Buffer Type	Function
K2	<b>PHYLED2_4</b>	I/O		<b>GPHY LED2 for Port 4</b> LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO33	Prg	Prg	<b>General Purpose IO 33</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
L3	<b>PHYLED3_4</b>	I/O		<b>GPHY LED3 for Port 4</b> LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO34	Prg	Prg	<b>General Purpose IO 34</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
R3	<b>TRSTN</b>	I		<b>JTAG Test Enabling</b> At logic HIGH, the GPIO pins are used as JTAG interface (TCK, TDI, TDO, and TMS). At logic LOW, the GPIO pins are used in their normal application mode. Voltage Domain: 3.3 V

## 2.2.3.8 Miscellaneous Signals

Table 11 Miscellaneous Signals

Ball No.	Name	Pin Type	Buffer Type	Function
<b>Reset and Clocking</b>				
E17	XTAL1	AI	A	<b>Crystal: Oscillator Input</b> A crystal must be connected between XTAL1 and XTAL2. Additional load capacitances must tie both pins to GND.
	CLK	AI	A	<b>Crystal Oscillator: Clock Input</b> A clock of 25 or 50 MHz must be connected to CLK. See <a href="#">Section 7.7.2</a> for the clock details. XTAL2 must not be connected.
E16	XTAL2	AO	A	<b>Crystal: Oscillator Output</b> A crystal must be connected between XTAL1 and XTAL2. Additional load capacitances must tie both pins to GND.
G18	CLKP_0	AO	A	<b>Differential Reference Clock Output 0</b> These pins provide the 25, 50, or 156.25 MHz differential reference clock used for a clock slave device.
G17	CLKN_0	AO	A	<b>Differential Reference Clock Output 0</b> These pins provide the 25, 50, or 156.25 MHz differential reference clock used for a clock slave device.
N17	CLKP_1	AO	A	<b>Differential Reference Clock Output 1</b> These pins provide the 25, 50, or 156.25 MHz differential reference clock used for a clock slave device.
N18	CLKN_1	AO	A	<b>Differential Reference Clock Output 1</b> These pins provide the 25, 50, or 156.25 MHz differential reference clock used for a clock slave device.
J17	GPC0	Prg		<b>General Purpose Clock 0</b> General purpose clock for external devices. Either input or output mode. Voltage Domain: 3.3 V
	GPIO44	Prg	Prg	<b>General Purpose IO 44</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	WSP_UTXD	Prg	Prg	<b>Software UART Data Output</b> Voltage Domain: 3.3 V

**Table 11 Miscellaneous Signals (cont'd)**

Ball No.	Name	Pin Type	Buffer Type	Function
J18	<b>GPC1</b>	Prg		<b>General Purpose Clock 1</b> General purpose clock for external devices. Either input or output mode. Voltage Domain: 3.3 V
	GPIO45	Prg	Prg	<b>General Purpose IO 45</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	WSP_UTXD	Prg	Prg	<b>Software UART Data Output</b> Voltage Domain: 3.3 V
J16	<b>GPC2</b>	Prg		<b>General Purpose Clock 2</b> General purpose clock for external devices. Either input or output mode. Voltage Domain: 3.3 V
	GPIO46	Prg	Prg	<b>General Purpose IO 46</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	WSP_URXD	Prg	Prg	<b>Software UART Data Input</b> Voltage Domain: 3.3 V
H17	<b>GPC3</b>	Prg		<b>General Purpose Clock 3</b> General purpose clock for external devices. Either input or output mode. Voltage Domain: 3.3 V
	GPIO47	Prg	Prg	<b>General Purpose IO 47</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
L16	<b>GPIO0</b>	Prg	Prg	<b>General Purpose IO 0</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 1.8 V / 3.3 V
	EXTINT0	Prg	Prg	<b>External Interrupt 0</b> Voltage Domain: 1.8 V / 3.3 V
D5	<b>GPIO1</b>	Prg	Prg	<b>General Purpose IO 1</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	EXTINT1	Prg	Prg	<b>External Interrupt 1</b> Voltage Domain: 3.3 V
	WSP_URXD	Prg	Prg	<b>Software UART Data Input</b> Voltage Domain: 3.3 V

**Table 11 Miscellaneous Signals (cont'd)**

Ball No.	Name	Pin Type	Buffer Type	Function
P4	<b>GPIO2</b>	Prg	Prg	<b>General Purpose IO 2</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
K4	<b>GPIO3</b>	Prg	Prg	<b>General Purpose IO 3</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
M1	<b>GPIO35</b>	Prg	Prg	<b>General Purpose IO 35</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
M3	<b>GPIO36</b>	Prg	Prg	<b>General Purpose IO 36</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
L2	<b>GPIO37</b>	Prg	Prg	<b>General Purpose IO 37</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
M2	<b>GPIO38</b>	Prg	Prg	<b>General Purpose IO 38</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
N3	<b>GPIO39</b>	Prg	Prg	<b>General Purpose IO 39</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
N2	<b>GPIO40</b>	Prg	Prg	<b>General Purpose IO 40</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
P1	<b>GPIO41</b>	Prg	Prg	<b>General Purpose IO 41</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
P2	<b>GPIO42</b>	Prg	Prg	<b>General Purpose IO 42</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
P3	<b>GPIO43</b>	Prg	Prg	<b>General Purpose IO 43</b> Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V

## 2.2.3.9 Power Supply for GPHY

**Table 12 Power Supply Pins for GPHY**

Ball No.	Name	Pin Type	Buffer Type	Function
C12	VDDA3V3_0	PWR		<b>GPHY 0 High Voltage Domain Supply</b> This is the PHY 0 AFE 3.3 V supply.
C10	VDDA3V3_1	PWR		<b>GPHY 1 High Voltage Domain Supply</b> This is the PHY 1 AFE 3.3 V supply.
C8	VDDA3V3_2	PWR		<b>GPHY 2 High Voltage Domain Supply</b> This is the PHY 2 AFE 3.3 V supply.
C6	VDDA3V3_3	PWR		<b>GPHY 3 High Voltage Domain Supply</b> This is the PHY 3 AFE 3.3 V supply.
T6	VDDA3V3_4	PWR		<b>GPHY 4 High Voltage Domain Supply</b> This is the PHY 4 AFE 3.3 V supply.
T8, T10, T12	VDDA3V3	PWR		<b>High Voltage Domain Supply</b>
D8	VDDA1V8_0	PWR		<b>GPHY 0, 1, 2, 3 AFE Voltage Domain Supply</b> This is the 1.8 V supply for PHY 0 to PHY 3 AFE voltage domain. It supplies mixed signal blocks in the AFE.
R8	VDDA1V8_1	PWR		<b>GPHY 4 AFE Voltage Domain Supply</b> This is the 1.8 V supply for PHY 4 AFE voltage domain. It supplies mixed signal blocks in the AFE.
F7, F12	VDDA0V8_0	PWR		<b>GPHY 0, 1, 2, 3 Low Voltage Domain Supply</b> This is the supply for PHY 0 to PHY 3 low voltage domain. It supplies mixed signal blocks in the AFE.
N7, N12	VDDA0V8_1	PWR		<b>GPHY 4 Low Voltage Domain Supply</b> This is the supply for PHY 4 low voltage domain. It supplies mixed signal blocks in the AFE.
G4, H4, L4, M4	VDD3V3PAD0	PWR		<b>Power Supply Digital Domain 3.3 V</b> 3.3 V Voltage Digital Power Supply
F15, G15, P15	VDD3V3PAD1	PWR		<b>Power Supply Digital Domain 3.3 V</b> 3.3 V Voltage Digital Power Supply
J15	VDDP_PAD	PWR		<b>Power Supply Digital Domain 1.8 V / 3.3 V</b> 3.3 V or 1.8 V Pad Voltage Digital Power Supply based on pin strapping.

**Table 12 Power Supply Pins for GPHY (cont'd)**

Ball No.	Name	Pin Type	Buffer Type	Function
G6, H6, G8, H8, H10, H11, G12, G13, J7, K7, J9, K9, L6, M6, L8, M8, L10, L11, M12, M13	<b>VDDD0V8_COR</b>	PWR		<b>Power Supply Digital Domain 0.85 V</b> 0.85 V Core Voltage Digital Power Supply
J13	<b>VDDA1V8PORXO</b>	PWR		<b>Power Supply Domain 1.8 V</b>
D9	<b>VDDA1V8_0</b>	PWR		<b>Power Supply Domain 1.8 V</b>
R9	<b>VDDA1V8_1</b>	PWR		<b>Power Supply Domain 1.8 V</b>
F10, G10	<b>VDDA1V2CDB0</b>	PWR		<b>Power Supply Domain 1.2 V</b>
M10, N10	<b>VDDA1V2CDB1</b>	PWR		<b>Power Supply Domain 1.2 V</b>
F9	<b>VDDA0V8_0</b>	PWR		<b>Power Supply Domain 0.85 V</b>
N9	<b>VDDA0V8_1</b>	PWR		<b>Power Supply Domain 0.85 V</b>
L13	<b>VDDA1V8_PLL</b>	PWR		<b>Power Supply Domain 1.8 V</b>
J11	<b>VDDD0V8REF</b>	PWR		<b>Power Supply Digital Domain 0.85 V</b>
K11	<b>VDDD0V8POST</b>	PWR		<b>Power Supply Digital Domain 0.85 V</b>
H12	<b>VDDA1V8_CML</b>	PWR		<b>Power Supply Domain 1.8 V</b>
K12	<b>VDDA0V8_CML</b>	PWR		<b>Power Supply Domain 0.85 V</b>
K13	<b>VDDA1V8_PVT</b>	PWR		<b>Power Supply Domain 1.8 V</b>
J12	<b>VCC1V8_OTP</b>	PWR		<b>Power Supply Domain 1.8 V</b>

## 2.2.3.10 Power Supply for USXGMII

**Table 13** Power Supply Pins for USXGMII

Ball No.	Name	Pin Type	Buffer Type	Function
C15, D14	VA0V8_0	PWR		USXGMII 0 - 0.85 V Analog Domain Supply
D15	VPHA1V8_0	PWR		USXGMII 0 - 1.8 V Domain Supply
R14, T15	VA0V8_1	PWR		USXGMII 1 - 0.85 V Analog Domain Supply
R15	VPHA1V8_1	PWR		USXGMII 1 - 1.8 V Domain Supply

### 2.2.3.11 Power Supply for TPI (AFE)

**Table 14** Power Supply Pins for TPI (AFE)

Ball No.	Name	Pin Type	Buffer Type	Function
A1, A16, C4, C5, C7, C9, C11, C13, C14, D2, D6, D7, D10, D12, D13, F6, F8, F11, F13	TPVSSA_0	GND		Analog Ground
N6, N8, N11, N13, R2, R6, R7, R10, R12, R13, T4, T5, T7, T9, T11, T13, T14, V1, V16	TPVSSA_1	GND		Analog Ground

## 2.2.3.12 Ground

**Table 15** Ground Pins

Ball No.	Name	Pin Type	Buffer Type	Function
D3, D4, E15, F4, G7, H7, G9, H9, G11, H15, H16, J4, J6, K6, J8, K8, J10, K10, K1, K3, K15, L7, M7, L9, M9, M11, L12, N4, N16, R4, R5	<b>VSSD</b>	GND		<b>Digital Ground</b>
A18, B18, C16, D18, R18, T16, U18, V18	<b>UVSS</b>	GND		<b>USXGMII Ground</b>
D16, D17, F16, H13	<b>VSS_XO</b>	GND		<b>XO Device Ground</b> XO ground

### 2.2.3.13 Not Connected Signals

**Table 16 Not Connected Signals**

Ball No.	Name	Pin Type	Buffer Type	Function
U4, V4, U5, V5, U6, V6, U7, V7, U8, V8, U9, V9, U10, V10, U11, V11, U12, V12, U13, V13, U14, V14, U15, V15	<b>NC</b>	-	-	<b>No Connect</b> These pins must not be connected.

## 3 Functional Description

### 3.1 Power Supply, Clock, and Reset

This section provides the information required to power up the MxL86252I.

#### 3.1.1 Power Supply

These four power supply rails are required: 3.3 V, 0.85 V, 1.8 V, and 1.2 V. [Section 7.7.1](#) contains the power-up sequence.

#### 3.1.2 Clock

An internal PLL circuit generates the required internal clocks, based on an external reference clock.

The available options are:

- An external 25 MHz crystal connected to the MxL86252I. [Section 7.7.11](#) documents the required crystal specification.
- 25 MHz direct from an external oscillator
- An external CML/LVPECL reference clock operating at 50 MHz

The MxL86252I provides two pairs of CML differential clock output to drive other chips. The available clock frequencies are:

- Input reference clock frequency
- 50 MHz
- 156.25 MHz

#### 3.1.3 Reset Generation

The external hardware reset input (HRSTN pin) resets all the hardware modules including the pin strapping information during boot:

- Driving the HRSTN pin low causes an asynchronous reset of the MxL86252I system.
- Releasing the HRSTN pin high triggers the power-on sequence.

The HRSTN pin is internally connected to a weak internal pull-up resistor.

#### 3.1.4 Power-On Sequence

The MxL86252I powers on when the power is applied and the HRSTN pin is high. See [Figure 25](#).

The steps executed at power on are:

1. Lock the internal PLL.
2. Read the pin strap information, see [Section 3.1.5](#) for more information.
3. Boot the microprocessor from the internal ROM.
4. Authenticate the firmware image in the flash memory device.
5. Auto-negotiate the link speeds for the Ethernet TPI and USXGMII interfaces.
6. Train and link up each interface in accordance with the IEEE 802.3 [\[6\]](#) standards.

### 3.1.5 Configuration by Pin Strapping

The MxL86252I is configurable by means of pin strapping on a number of the GPIO pins. The pin strapping configurations are captured during the chip power-on sequence until the reset initialization is complete.

The pin strap values are set to logical high or low by connecting the corresponding pin via an external 1 kΩ resistor to either ground or the pin supply voltage.

**Table 17** and **Table 18** describe the pin strap mapping.

**Table 17 Pin Names Used for Pin Strapping**

Ball Name	Ball Number	Configuration Item Description
GPC1	J18	PS_PHY_MADDR(4)
GPC2	J16	PS_PHY_MADDR(3)
GPC3	H17	PS_CLK_SEL
GPIO1	D5	PS_CLK_SEL1
GPIO2	P4	PS_RJ45_TAB
MDINT	G16	PS_MDINT_POLARITY
GPIO3	K4	PS_MDIO_VOLTAGE
GPC0	J17	PS_SUPER_ISOLATE

**Table 18 Pin Strapping Configuration Description**

Pin Strapping Signals	Description
PS_PHY_MADDR(4:3)	<b>MDIO Address</b> Specifies the most significant two bits of the MDIO address. The lowest three bits of the switch MDIO address are hard-coded to 0.
PS_MDINT_POLARITY	<b>MDIO Interrupt Polarity</b> Specifies the polarity of the MDIO interrupt. 0 <sub>B</sub> <b>HIGH</b> MDIO interrupt is active high. 1 <sub>B</sub> <b>LOW</b> MDIO interrupt is active low.
PS_RJ45_TAB	<b>RJ45 Tab Configuration</b> Specifies the tab-up or tab-down configuration of the RJ45. Each BASE-T port has the same configuration. 1 <sub>B</sub> <b>DOWN</b> Tab-down 0 <sub>B</sub> <b>UP</b> Tab-up
PS_MDIO_VOLTAGE	<b>MDIO Voltage</b> Specifies whether the maximum voltage level used by the MDIO signals is 3.3 V or 1.8 V. 0 <sub>H</sub> <b>LOW</b> MDIO_S, MDC_S, MDINT, MDIO_M, MDC_M, and GPIO0 signal pins are supplied with 1.8 V. In this configuration, V <sub>DDP</sub> must be supplied with 1.8 V. 1 <sub>H</sub> <b>NORMAL</b> MDIO_S, MDC_S, MDINT, MDIO_M, MDC_M, and GPIO0 signal pins are supplied with 3.3 V. In this configuration, V <sub>DDP</sub> must be supplied with 3.3 V.

**Table 18 Pin Strapping Configuration Description (cont'd)**

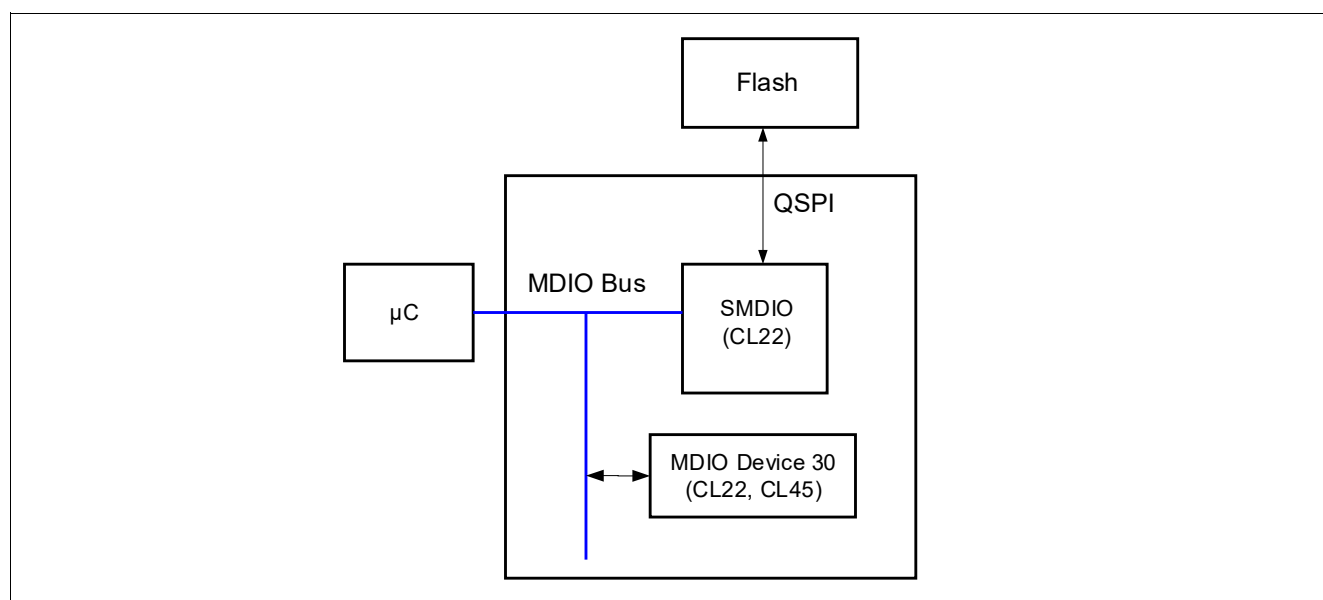

Pin Strapping Signals	Description
PS_CLK_SEL PS_CLK_SEL1	<b>Input Clock Selection</b> Specifies the input clock frequency used. MSB is PS_CLK_SEL1. LSB is PS_CLK_SEL. 11 <sub>B</sub> <b>25</b> 25 MHz 10 <sub>B</sub> <b>50</b> 50 MHz 01 <sub>B</sub> <b>RES</b> Reserved 00 <sub>B</sub> <b>RES</b> Reserved
PS_SUPER_ISOLATE	<b>Super Isolate</b> Specifies whether the PHY is immediately active after a reset or is halted until it is manually activated. 0 <sub>H</sub> <b>HALT</b> The PHYs are inactive after reset. 1 <sub>H</sub> <b>NORMAL</b> The PHYs are active after reset.

Alternative ways to configure the MxL86252I after the boot process are to use the MDIO interface [5] and write into various control registers, as detailed in [Section 3.3](#), or to use the FCA [2].

## 3.2 MDIO Slave Interface

The SMDIO module and the MDIO Device 30 module are directly attached to the MDIO slave interface as shown in the [Figure 4](#). The MDIO Device 30 is the vendor specific 1 device for MMD=30, which supports both IEEE 802.3 clause 22 and clause 45 protocol. It allows access to the switch and the PHY configurations using the correct MDIO PHY address. The MDIO address used for this access is configurable through pin-strapping, as described in [Section 3.1.5](#). A switch driver executed by the micro-controller in the figure allows configuration of the MxL86252I. The switch driver is part of the host SoC API software documented in the MxL86252I API.

The SMDIO module provides access to the external flash memory device via the QSPI interface. The MxL86252I supports downloading of firmware to the flash memory device via the SMDIO module attached to the MDIO bus. The MDIO address used for this access is the same MDIO address as defined by the pin strapping. The MxL86252I user guide [\[2\]](#) or [\[5\]](#) describes the driver software executed on the external processor which must be followed to perform this feature. The SMDIO module supports only IEEE 802.3 clause 22 protocol.

**Figure 4 MDIO Slave**

When other devices in the system need to be configured through MDIO, they must be connected to the MDIO slave interface and configured such that no addressing conflict arises.

The standard MDIO protocol requires a 32-bit preamble at the beginning of each read or write access. To speed up the data exchange, reduce the preamble down to 1 bit for the second and subsequent accesses.

The standard MDIO protocol uses a clock rate of 2.5 MHz on MDC. To speed up the data exchange, increase the clock applied on MDC\_S to the maximum 25 MHz. [Section 7.7.4](#) contains more details on AC characteristics.

### 3.3 Configuration via MDIO Management Interface

It is possible to connect an external controller's STA to the chip's slave MDIO interface. This allows access to the MDIO and MMD registers standardized in IEEE 802.3, enabling the STA to control the chip configuration and retrieve status information. The MDIO transactions are any of the three types described in IEEE 802.3 Clause 22, Clause 22 Extended, and Clause 45 [6].

Figure 5 and Table 19 show the minimum time required for the MDIO to be available for access.

Figure 5 MDIO Access Timing

Table 19 MDIO Ready Timing

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
MDIO Ready Time	$T_{MDIO}$	750	—	—	ms	

### 3.4 MDIO Master Interface

The MDIO master module provides the register interface to access the registers of external Ethernet PHYs.

The interface uses the serial protocol defined by IEEE 802.3, clause 22 or clause 45. It is possible to address up to 32 external devices through a 5-bit PHY address (PHYADR). Each MDIO access includes start type (clause 22 or 45), access type (address/read/write/post-increment command), 5-bit PHY address, 5-bit register/device address, and 16-bit read/write data.

The MDIO master interface shares pins with the GPIO function. When there is no requirement to access an external PHY or device via the MDIO master interface, the pins are configurable for GPIO or an alternative function as shown in the [Chapter 2 External Signals](#).

### 3.5 I<sup>2</sup>C Master Interface

The MxL86252I has two chip-integrated I<sup>2</sup>C master controllers to handle SFPs. The Inter-IC (I<sup>2</sup>C) Bus was developed by Philips Semiconductors (now NXP Semiconductors). This specification is compliant with [\[14\]](#).

The I<sup>2</sup>C is a simple, bi-directional half-duplex bus with data transfers of up to 100 Kbps in standard mode, up to 400 Kbps in fast mode, up to 1000 Kbps in fast mode plus, and up to 3.4 Mbps in high-speed (hs) mode.

I<sup>2</sup>C provides a protocol allowing devices to communicate directly with each other via two wires. One line is responsible for the clock synchronization (SCL), the other is responsible for the data transfer (SDA). The number of devices connected to the I<sup>2</sup>C bus is limited only by a maximum bus capacity of 400 pF. Each device is recognized by a unique address.

The two bi-directional bus lines, a Serial Data (SDA) line and a Serial Clock (SCL) line, are connected to a positive supply voltage via pull-up resistors. The output stages of devices must have an open drain to perform the required wired-AND function. One line is pulled low when one of the open-drain transistors is selected. Otherwise, no signal is asserted to the line. The external pull-up resistors lift the level to HIGH.

The I<sup>2</sup>C specification defines a master/slave relationship where each device works either as a transmitter or a receiver depending on the device function. This functionality is set in the initialization procedure of each module.

#### Features

- Two identical I<sup>2</sup>C controllers
- Master-mode supported
- Compatible to the I<sup>2</sup>C specification version 6.0, April 2014<sup>1)</sup>
- Data transfer in standard- (0 to 100 kBaud), fast- (0 to 400 kBaud), fast mode plus (0 to 1 Mbps) and high-speed mode (0 to 3.4 Mbps)

1) For deviations of timing values compared to the Philips Semiconductors (now NXP Semiconductors\*) specifications, see [Chapter 7 Electrical Characteristics](#).

### 3.6 Quad Serial Peripheral Interface

A Quad Serial Peripheral Interface (QSPI) is equipped to provide access to external Quad-SPI flash memory devices. The MxL86252I requires an external Quad-SPI flash memory to operate.

The QSPI supports:

- Up to 101.5625 MHz for single/double data rate
- eXecution In Place (XIP), fully memory mapped access for CPU
- Addressing up to 512 MB range

#### 3.6.1 Supported Flash Memory Devices

[Table 20](#) lists the qualified flash memory devices. However, it is possible for the user to select a device not present in the list after consideration of command compatibility and timing compatibility as listed in [Table 21](#). The flash memory device must support 101.5625 MHz single data rate.

**Table 20 Supported Flash Memory Devices**

Vendor	Model
Macronix	MX25L6433F
Winbond	W25Q64JV-DTR

**Table 21 Flash Command and Timing**

Instruction	Abbreviation	Command	Command Cycles	Address Cycles	Dummy Cycles	Data Cycles
Write Enable	WREN	06 <sub>H</sub>	8	0	0	0
Write Disable	WRDI	04 <sub>H</sub>	8	0	0	0
Read ID	RDID	9F <sub>H</sub>	8	0	0	24

Reset Enable	RSTEN	66 <sub>H</sub>	8	0	0	0
Reset	RST	99 <sub>H</sub>	8	0	0	0

1) n is the number of bytes

### 3.7 GPIO Mapping

Other than the GPIO functionality, the GPIO pins are also shared with other alternative functions. The GPIO pins are configurable to alternative functions, which are based on the pinmux settings as shown in [Table 22](#).

**Table 22 GPIO Mapping**

Pinmux Mode 0 (Default)	Pinmux Mode 1	Pinmux Mode 2	Pinmux Mode 3

### 3.8 Ethernet PHY Interface

The Ethernet PHY implements the physical layer of the Ethernet standard. It supports Digital Signal Processing (DSP) and Analog Signal Processing (ASP) functions in transmitting data over the twisted pair cable.

#### 3.8.1 Twisted Pair Interface

The Twisted Pair Interface (TPI) of the MxL86252I is fully compliant with IEEE 802.3. The MxL86252I integrates series resistors required to terminate the TPI links with a 100  $\Omega$  nominal impedance to facilitate a low-power implementation and reduce PCB costs. As a consequence, it is possible to connect the TPI pins directly via a transformer to the RJ45 connector. Additional external circuitry is required for common-mode termination and rejection as described in [Section 7.8.1](#).

**Figure 6** shows a schematic of the TPI circuitry taking these components into account.

**Figure 6** Twisted-Pair Interface of MxL86252I Including Transformer and RJ45 Plug

#### 3.8.2 Transformerless Ethernet

Transformerless Ethernet (TLE) is required for backplane applications where the use of a transformer is not always required to fulfill the galvanic decoupling requirements of the isolation specifications. In such applications, removing the transformer reduces both the external bill of material and the space requirements on the PCB.

As the MxL86252I incorporates a voltage-mode line driver, the only stringent requirement is to use AC coupling, which is achievable using simple SMD type series capacitors. The value of the capacitors is selected such that the high-pass characteristics correspond to an equivalent standard transformer based application. The recommended value is  $C_{\text{coupling}} = 100 \text{ nF}$ . **Figure 7** shows the external circuitry for TLE.

**Figure 7** External Circuitry for the Transformerless Ethernet Application

### 3.8.3 Auto-Negotiation

The MxL86252I supports auto-negotiation (ANEG) as part of the startup procedure to exchange capability information with the link partner. ANEG is enabled at the MxL86252I initialization and its 2.5 Gbps speed capability is advertised. The ANEG procedure is executed according to IEEE 802.3 Clause 28, Clause 40, and IEEE 802.3 Clause 126 [6]. When the link partner does not support ANEG, the MxL86252I determines the link speed configuration using parallel detection as described in Clause 28.

With MDIO commands, it is possible to disable ANEG and change the advertised link rates. The STA is also able to disable ANEG. In this situation, the system configuration must ensure compatibility between link partners to allow link up in a compatible mode.

**Attention:** *STD\_CTRL.DPLX only takes effect when the ANEG process is disabled and the GPHY TPI is not operating in loopback mode, that is, bits STD\_CTRL.ANEN and STD\_CTRL.LB are set to zero. Forced half-duplex mode (STD\_CTRL.DPLX = 0b0) is only supported in 10BASE-T and 100BASE-TX speed modes. This field is ignored for higher speeds.*

### 3.8.4 Auto-Downspeed

The auto-downspeed (ADS) feature implements a process to renegotiate the link with a lower speed when the link quality is insufficient. The feature ensures maximum interoperability even in harsh, or inadequate, cable infrastructure environments. In particular, ADS is applied during the 2.5GBASE-T/1000BASE-T training phase. ADS is also required when the quality or characteristics of the cable in use cannot support the advertised speed. For example, it is possible to advertise 2.5GBASE-T/1000BASE-T during ANEG when both link partners are connected via a cable that does not support the 4-pair Gigabit Ethernet mode. The MxL86252I detects such a configuration to avoid repeating link up failures and clears the 2.5GBASE-T/1000BASE-T capability in the ANEG advertisement registers. After the resulting link down, the next ANEG procedure no longer advertises 1000BASE-T/2.5GBASE-T. The next link up is done at the next advertised speed below 1000 Mbps.

The MxL86252I also executes an ADS procedure when the signal quality is not suited to a 1000BASE-T/2.5GBASE-T link up due to increased alien noise or a loop length that significantly exceeds the standard specification.

When the MxL86252I is configured not to advertise a speed capability below 1000 Mbps, the ADS feature is automatically disabled.

### 3.8.5 Polarity Reversal Correction

For each of the 4 pairs, the MxL86252I automatically detects and corrects any inversion of the signal polarity on the P and N signals. The detection is done during the auto-negotiation phase. The detected polarity is frozen when the link is established, and remains unchanged until the link is dropped.

The polarity corrections applied are indicated in the register: PMA\_MGBT\_POLARITY (register 1.130); and are valid after auto-negotiation is complete.

### 3.8.6 Auto-Crossover Correction

To maximize interoperability, even in inadequate wiring environments, the MxL86252I automatically performs cable crossover (MDI-X) correction. Table 23 lists the supported pair-mappings detectable and correctable by the device.

The MxL86252I automatically detects and corrects crossed cable configuration, where the transmit-receive pairing between partners does not match. The auto-crossover function is fully compliant with IEEE 802.3, Clause 40.4.4 [6], in 1000BASE-T and 2.5GBASE-T mode.

The corrections applied are indicated in the register: PMA\_MGBT\_POLARITY (register 1.130) and are valid when auto-negotiation is complete.

**Table 23 Supported Twisted Pair Mappings on a Cat 5 or Better Cable**

Crossover Modes on RJ45 <sup>1)</sup>		RJ45 Pinning							
Mode	Description	1	2	3	4	5	6	7	8
11	Straight cable, standard compliant	TPIAP (A+)	TPIAN (A-)	TPIBP (B+)	TPICP (C+)	TPICN (C-)	TPIBN (B-)	TPIDP (D+)	TPIDN (D-)
00	Full Gigabit Ethernet MDI-X This is standard-compliant MDI-X with pair A/B swapped and pair C/D swapped.	TPIBP (B+)	TPIBN (B-)	TPIAP (A+)	TPIDP (D+)	TPIDN (D-)	TPIAN (A-)	TPICP (C+)	TPICN (C-)

1) This pin assignment is according to TIA/EIA-568-A/B.

### 3.8.7 RJ45 Tab Up or Tab Down Configuration

**Figure 8** shows that the RJ45 plug on the system PCB is solderable with the tab either up or down.

The difference between tab up and tab down is a swap in position between A and D, and a swap in position between B and C. The pin strap `PS_RJ45_TAB` allows the system designer to perform this configuration. As a result, a PCB layout does not need to be modified when a RJ45 tab up or down socket needs to be mounted. The single pin strap is applicable to all ports, which are either all tab down or all tab up.

**Figure 8 RJ45 Tab Up or Tab Down Configuration**

### 3.8.8 Wake-on-LAN

The MxL86252I supports WoL. The MxL86252I generates an interrupt to an external controller or to an internal controller when it detects special WoL Ethernet packets. This allows the controller to enter sleep mode when there is no Ethernet traffic to process, and be woken up when traffic starts. WoL packets are detected at all link speeds.

**Figure 9** shows the scenario when connected to an external device.

**Figure 9** WoL Application Block Diagram

The most commonly used WoL packet is called a magic packet, which contains the MAC address of the device to be woken up, and an optional password called SecureON. The MAC address and the optional SecureON password relevant for the WoL logic inside the MxL86252I are configurable in the WoL MDIO registers in the Vendor Specific 2, VSPEC2 MMD, device described in **Chapter 4**. When such a configured magic packet is received, an interrupt is issued.

**Table 24** gives an example programming sequence for these configuration registers.

**Table 24** Programming Sequence for the Wake-on-LAN Functionality

Step	Register Access	Remark
1	MDIO.MMD.WOLAD01 = EEFF <sub>H</sub>	Programs the fifth and sixth MAC address bytes.
2	MDIO.MMD.WOLAD23 = CCDD <sub>H</sub>	Programs the third and fourth MAC address bytes.
3	MDIO.MMD.WOLAD45 = AAB <sub>H</sub>	Programs the first and second MAC address bytes.
4	MDIO.MMD.WOLPW01 = 4455 <sub>H</sub>	Programs the fifth and sixth SecureON password bytes.
5	MDIO.MMD.WOLPW23 = 2233 <sub>H</sub>	Programs the third and fourth SecureON password bytes.
6	MDIO.MMD.WOLPW45 = 0011 <sub>H</sub>	Programs the first and second SecureON password bytes.
7	MDIO.PHY.IMASK.WOL = 1 <sub>B</sub>	Enables the wake-on-LAN interrupt mask.
8	MDIO.MMD.WOLCTRL.WOL.EN = 1 <sub>B</sub>	Enables wake-on-LAN functionality.

### 3.9 Ethernet SerDes Interface

The MxL86252I implements two Ethernet serial data interfaces. [Table 25](#) lists the data rates supported by the USXGMII interface.

The external PHY is able to initiate clause 37 auto-negotiation to change speed and new link up in SGMII and USXGMII modes.

**Table 25 Ethernet SerDes Interface Feature List**

Modes	Baudrate	Coding	Link Speed	IEEE Clause	Auto-Negotiation Clause
10G-(K)R/XFI/SFI	10.3125 GT/s	64b/66b	10 Gbps	49	NA
2.5G-(K)X	3.125 GT/s	8b/10b	2.5 Gbps	36	NA
SGMII-1G	1.25 GT/s	8b/10b	1 Gbps, 100 Mbps, and 10 Mbps	36	37
SGMII-2.5G	3.125 GT/s	8b/10b	2.5 Gbps	36	NA
2.5G-SXGMII	2.578125 GT/s	64b/66b	2.5 Gbps, 1 Gbps, 100 Mbps, and 10 Mbps	49	37
10G-SXGMII	10.3125 GT/s	64b/66b	10 Gbps, 5 Gbps, 2.5 Gbps, 1 Gbps, 100 Mbps, and 10 Mbps	49	37

#### 3.9.1 Ethernet SerDes Interface Configuration at Power On

Use a flash or management interface to configure the SerDes interface before bringing the interface up. The FCA, documented in [\[2\]](#), can be used to pre-configure this interface before programming the FW in the flash. For the MDIO-managed mode of operation, the MDIO management interface can also be used to configure this interface via API.

### 3.10 LED Interface

This section describes the LED interface.

#### 3.10.1 LED

The MxL86252I allows 15 synchronized LEDs to be used for visual status indication. Each LED pin drives either a single color LED or dual color LED.

#### 3.10.2 LED Configuration

The MxL86252I API describing the driver software executed on the Host SoC must be followed to configure this interface. When there is no Host SoC attached, it is possible for the configurations to be done in the FCA [2].

**Figure 10** shows the external LED connected to either ground or the power rail in single color mode.

**Figure 11** and **Figure 12** show the connection of single and dual color LEDs when the pin is also used for pin strapping.

*Note: These figures do not show the full recommended circuits with all the necessary components. Refer to the relevant HDK/EVK PCB design documentation for more details.*

**Figure 10 LED Connection Options to Ground or Power Supply**

**Figure 11 Connection of a Dual Color LED and Configuring Pin Strap Value**

**Figure 12 Connection of a Single Color LED and Configuring Pin Strap Value**

### 3.10.3 LED Brightness Control

There are two LED brightness modes configurable by the API for the MDIO-managed mode, or FCA [2] for the smart mode and the unmanaged mode, based on the system requirement.

- LED Brightness Level Maximum Mode  
Fixed level signal (no pulses) for maximum brightness, also available as a control signal for other purposes.
- LED Brightness Level Control Mode (Constant Mode)  
Allows the configuration of 16 levels of LED brightness. See [Brightness Control](#).

#### Brightness Control

This block controls the brightness of the LED by controlling the time duration for which the LED is on/off. The persistence characteristic of the eye causes it to perceive this as LED brightness. When LED is off, the output is disabled. When the LED is on, the output is enabled. The brightness control affects the LED output enable directly.

[Figure 13](#) shows the brightness control frequency is 81.25 Hz, where each period is divided into 64 slots.

In the LED brightness level maximum mode, the LED is enabled in all 64 slots, as shown in brightness level 0 which is the maximum brightness.

In the LED brightness level control mode, the LED is enabled for  $n$  consecutive slots, where  $n$  is determined by the configured brightness level. [Figure 13](#) shows the brightness level in active low mode, whereby brightness level 15 is the minimum brightness.

**Figure 13 LED Brightness Control by Controlling LED Output Enable/Disable**

### 3.11 Precision Time Protocol

The MxL86252I provides support for the Precision Time Protocol (PTP) feature, which is used to precisely synchronize clocks at the system level. PTP is used to synchronize the time of day (ToD) of slave clocks to a master clock over Ethernet networks. It is standardized in IEEE 1588-2002, and in IEEE 1588-2008 as a second revision (1588v2). The MxL86252I has built-in hardware support to provide high precision and easy to use PTP clock synchronization.

The MxL86252I supports PTP with these features:

- Implementation of a 64-bit counter, which counts with a granularity of 2 ns.
- Two 16 entry deep FIFOs with overflow and underflow support, one FIFO to store the timestamps and CRCs of outgoing packets, and one FIFO to store the timestamps and CRCs of incoming packets.
- Timestamps are captured with high precision in transmitted and received PTP packets when the start of frame delimiter of a packet is detected.
- Timestamps can be triggered by the edge of an input signal to allow synchronous latching of the timestamp of the on-chip counter, and the counter of an external master or slave clock to calculate counter differences. It is possible to select GPC0, GPC1, GPC2, or GPC3 as the input for the trigger signal.
- A recurring pulse signal can be generated either at the GPC0, GPC1, GPC2, or GPC3. The signal can be a Pulse Per Second (PPS) signal or a signal with another configurable frequency.

- **2-step Time Stamping**

This scheme uses a Follow\_Up message to carry the time stamp of the corresponding sync message. The time stamp is not inserted in the sync message on the fly while the packet is being transmitted, but later in the next PTP message. This scheme allows the MxL86252I to perform hardware-assisted precise time stamping capture, using the PHY layer to precisely indicate when the packet Start-of-Frame Delimiter (SFD) symbol is sent out or received on the physical layer. The time stamp, together with the corresponding packet CRC, is stored in a memory area on the MxL86252I.

- **1-step Time Stamping**

This scheme is used to reduce the number of PTP messages. In this scheme, the MxL86252I MAC inserts the time stamp in the sync message on the fly when it passes through the MxL86252I MAC layer. The MxL86252I inserts the time stamp in the PTP sync message on the fly.

#### 3.11.1 PTP Configuration

The MxL86252I API describing the driver software executed on the external processor SoC must be followed to configure this feature for the MDIO-managed mode.

For the smart mode, this feature can be configured via web-pages.

For the unmanaged mode, pre-configuration can only be done in the FCA.

### 3.12 Pulse Per Second

The MxL86252I provides support for Pulse Per Second (PPS) signal generation, which is used at the PCB level to synchronize various devices, such as the 10G PHY. The general purpose clock pins GPC0, GPC1, GPC2, or GPC3 are configured for this purpose.

#### 3.12.1 PPS Configuration

The MxL86252I API describing the driver software executed on the external processor SoC must be followed to configure this feature for the MDIO-managed mode.

For the smart mode and the unmanaged mode, configuration can only be done in the FCA.

### **3.13 Synchronous Ethernet**

The MxL86252I allows a Synchronous Ethernet (SyncE) interface to support transportation of a source clock from a clock master to clock clients. When the TPI is a clock slave, the MxL86252I receives the synchronization clock from the Ethernet cable, and provides it to the system on pin GPC0, GPC1, GPC2, or GPC3. When the TPI is a clock master, the MxL86252I receives the clock from the system on pin GPC0, GPC1, GPC2, or GPC3 and sends it over the Ethernet cable as a clock master.

It is configurable to synchronize to one of these clock sources:

- Recovered received clock by SerDes
- Recovered received clock by 2.5G BASE-T PHY
- Input clock via GPC0, GPC1, GPC2, or GPC3

These functions are clocked from the synchronized clock:

- SerDes
- 2.5GBASE-T PHY
- 1588/PTP timers
- Output clock via GPC0, GPC1, GPC2, or GPC3

Loss of signal detection is integrated on chip and all the modules are supplied seamlessly with clocks generated from the local source when the external master clock signal is not available.

#### **3.13.1 SyncE Configuration**

The MxL86252I API describing the driver software executed on the external processor SoC must be followed to configure this feature for the MDIO-managed mode.

For the unmanaged or web-smart switch, configuration will be done in the FCA.

### 3.14 Power Management

This section describes the power management functions of the MxL86252I integrated Ethernet PHY.

#### 3.14.1 Power States

**Figure 14** illustrates the power states and transitions of each integrated Ethernet PHY.

In this state diagram, the (0.11) syntax corresponds to the value of bit 11 from register 0 in device 0, which is `STD_CTRL.PD`. This is the Power Down (PD) bit in `MDIO STD_CTRL`, described in [Chapter 4](#). The STA is able to use this `STD_CTRL.PD` field to bring the physical interface into the **POWER DOWN State**.

The other states are automatically entered by the MxL86252I depending on the context, and following the IEEE protocol. This is done without any intervention from the STA.

The Normal Link Pulse (NLP) and Fast Link Pulse (FLP) are received on the TPI from a link partner and used to wake up the MxL86252I and enter auto-negotiation.

**Figure 14 State Diagram for Power Down State Management**

#### 3.14.2 RESET PWRUP

The MxL86252I starts up in the RESET Power Up (PWRUP) state after either a hardware reset or power up.

After initialization, the PHYs always transition to the **SCAN (ANEG) State**.

#### 3.14.3 POWER DOWN State

The **POWER DOWN State** is entered by setting the PD bit (0.11) of the MDIO standard register `STD_CTRL` to 1, regardless of the current state of the device. The **POWER DOWN State** corresponds to power down as specified in IEEE 802.3, Clause 22.2.4.1.5. Some signal processing blocks are stopped to save energy, but the MxL86252I still responds to MDIO messages.

Exiting the **POWER DOWN State** is triggered by setting the PD bit (0.11) of `STD_CTRL` to 0, which initiates a transition to the **SCAN (ANEG) State**.

### 3.14.4 SCAN (ANEG) State

The SCAN state differs from the **POWER DOWN State** in that the receiver periodically scans for signal energy or FLP bursts on the TPI. There is no transmission in this state. When an FLP burst is received, the MxL86252I enters the auto-negotiation protocol to exchange capabilities with the link partner and establish a data link in the **NORMAL State**.

### 3.14.5 PING (ANEG) State

The PING state is similar to the **SCAN (ANEG) State** except that the transceiver transmits an FLP burst onto the TPI for a programmable amount of time. This is used to wake potential link partners from the **POWER DOWN State**. This state corresponds to the state of ANEG described in Clause 28 of the IEEE standard [6].

### 3.14.6 Low-Power State

The MxL86252I's Low-Power (LP) state is enabled by configuring the MDIO register `PHY_CTL2.LP`. The LP state is entered automatically when there is no Ethernet cable connected to the MxL86252I. The MxL86252I firmware detects this condition when no energy or Link Pulse is present on the TPI and enters the LP state. It is intended to set the MxL86252I into its maximum power saving state. In this state, most digital domains are in reset. Only a minimal amount of circuitry (analog/digital) operates to detect signal energy on the receiver of a TPI and trigger a wake-up.

When the port is in the LP state, the STAs do not have access to the corresponding MDIO/MMD registers.

The LP state is exited upon detection of signal energy on the twisted pair (either NLP or FLP). The port transitions to the **RESET PWRUP** state automatically. The STA host is also able to trigger an LP state exit by applying an API to wake up the specific port that entered the LP state.

It is possible for the STA host to be informed of the LP entry condition. By setting the `PHY_IMASK.LP` bit to ACTIVE, the STA requests the MDINT interrupt from the port when the entry conditions are met. **Figure 15** shows all the LP related control bits and communication mechanism between the STA and the MxL86252I.

It is possible for the STA host to be informed of the LP exit condition. By setting the `VSPEC1_IMASK.CDET` bit to ACTIVE, the STA requests the MDINT interrupt from the port when energy on the link is detected during auto-negotiation. Even when none of the ports are in the LP state, this interrupt is triggered whenever energy is first detected on the link. When the STA triggers the LP state exit via a wake-up request, and there is no energy on the link after the LP state exit, no interrupt is asserted.

**Attention: An active-high MDINT in push-pull mode (default is tristate mode) is not supported in the LP mode.**

**Attention: VSPEC1\_IMASK.CDET is not supported in forced speed 10BASE-T/100BASE-TX mode. Auto-negotiation is required to support this feature.**

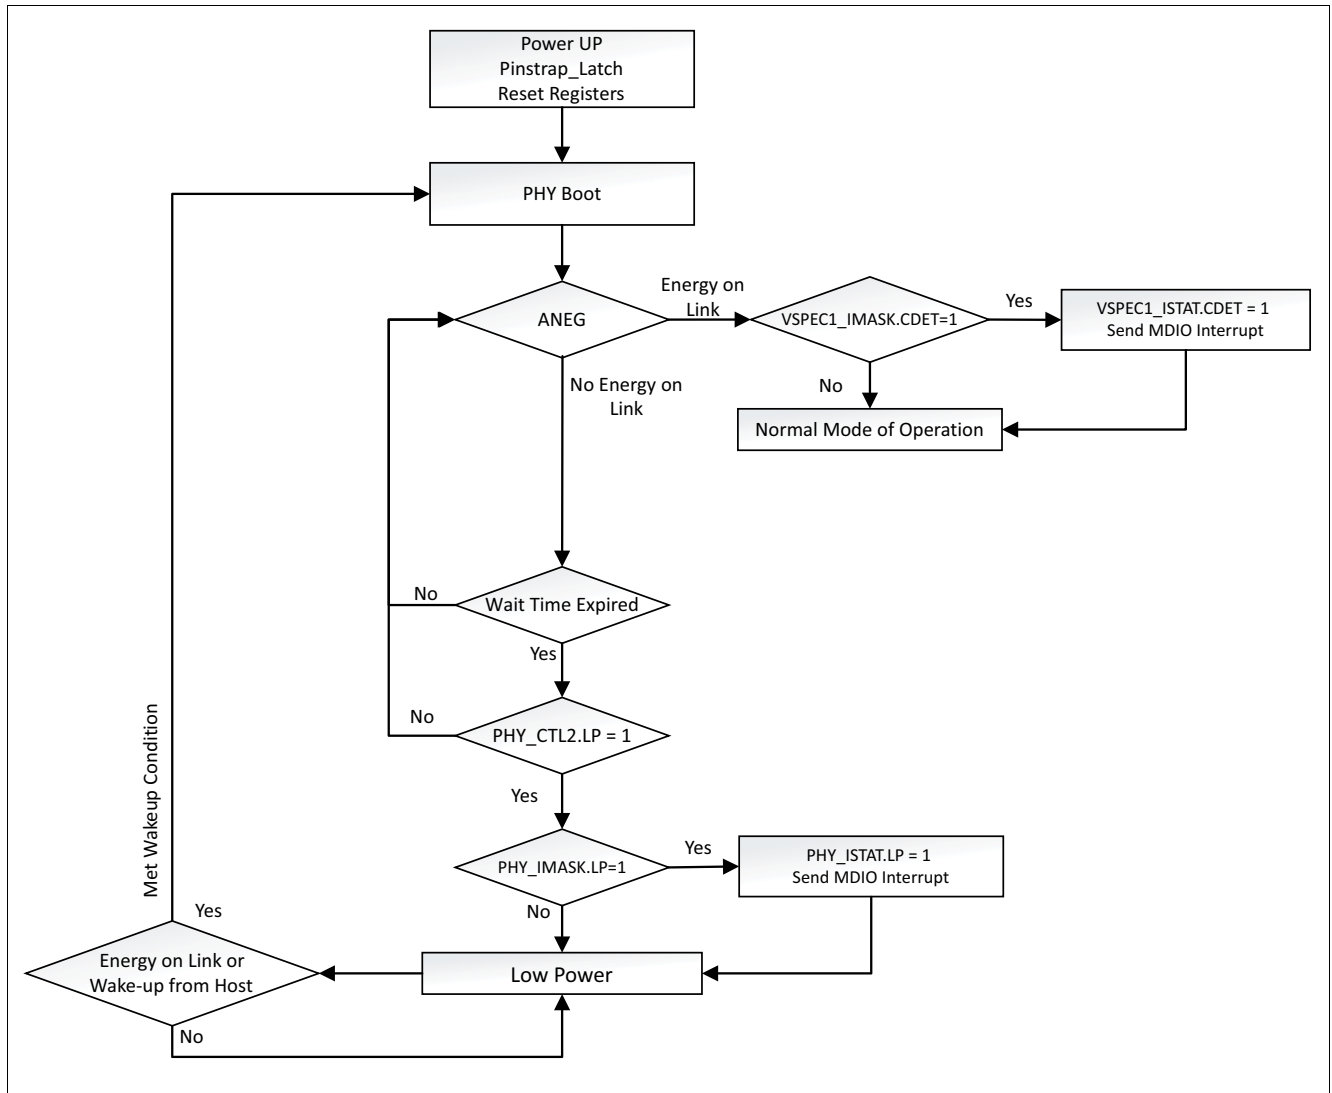

Figure 15 Low Power Sequence

**Table 26 Low Power State Entry and Exit Sequence**

Step	State	Remark
1	ACTIVE The LP feature is enabled by setting <code>PHY_CTL2.LP = 1</code>	Use the MDIO register <code>PHY_CTL2.LP</code> to enable or disable the LP feature.
2	ANEG, Ability Detect	The firmware detects no energy on the cable when no FLP is received for a long period of time. When the LP feature is not enabled, this time is fixed to between 6.4 and 9.6 seconds. When the LP feature is enabled, this time is configured using the <code>VSPEC1_LOW_POWER_ENTRY_TIME.LPE_TIM</code> register. Time in seconds = 4 x value programmed. Default time is 4 seconds. ( <code>VSPEC1_LOW_POWER_ENTRY_TIME.LPE_TIM = 1</code> ). There is an initial time of between 2.4 and 5.6 seconds, which adds on to the programmed time.
3	LP Entry Timer	This time is configured with the <code>VSPEC1_LOW_POWER_ENTRY_TIME.LPE_TIM</code> register. The value is set in steps of 4 seconds. The default time is 4 seconds.
4	LP Entry	The MxL86252I saves MDIO LP persistent registers. An interrupt is sent to indicate entry into the LP state.
5	LP State	Power consumption is saved in this state. The MxL86252I listens to energy pulses from the link partner ANEG as a condition to trigger an exit from the LP state. Only a minimal amount of circuitry operates to detect signal energy on TPI and trigger a wake-up. The port LEDs and MDIO interface are disabled.
6	LP Exit (Option 1) Based on energy detected on the cable	The MxL86252I restores the configurations in the MDIO registers. An interrupt is sent to indicate an exit from the LP state.
7	LP Exit (Option 2) Based on a wake-up request from the STA	The STA is able to request an LP exit by using a provided API. The MxL86252I restores the configurations in the MDIO registers. No interrupt is sent to notify LP exit. Not applicable if MxL86252I is not managed via MDIO.
8	ANEG, LINK-UP, and ACTIVE	The MxL86252I operates in normal power modes.

These are persistent MDIO registers saved and restored during LP entry-exit.

### 3.14.7 NORMAL State

The NORMAL state is used to establish and maintain a link connection. When a connection is dropped, the MxL86252I moves back into the **SCAN (ANEG) State**.

### 3.14.8 Low Power IDLE State - Energy-Efficient Ethernet

The IEEE 802.3 standard [6] describes the EEE operation supported by the MxL86252I in the various speeds of 100BASE-TX, 1000BASE-T, and 2.5GBASE-T. The general idea of EEE is to save power during periods of low link utilization. Instead of sending active idle data, the transmitters are switched off for a short period of time. This is called the quiet period. The link is kept active by means of a frequent refresh cycle initiated by the PHY itself while in the low power state. This sequence is repeated until a wake request is generated by one of the link partner MACs. The MxL86252I follows the IEEE 802.3 standard regarding EEE. Figure 16 illustrates the principle. This state is entered automatically when the low power idle conditions are met.

Figure 16 EEE Low Power Idle Sequence

### 3.15 Firmware Upgrade

The MxL86252I provides a Firmware Upgrade feature that allows feature and functional enhancements of the MxL86252I in the field.

It is possible to download a new firmware image via the MxL86252I's **MDIO Slave Interface** to a serial flash memory device connected to the MxL86252I's QSPI. The MxL86252I is then able to fetch the upgraded firmware from the flash memory after a reboot. The flash memory device must have enough storage for at least two images. The upgrade does not overwrite the original image, but writes to a different location to avoid corrupting the original image.

For the Security Development Lifecycle (SDL) [16] reasons, the MxL86252I only accepts electronically signed firmware images. When authentication of the flash image by the MxL86252I fails during the firmware upgrade process, or the download of the image to the flash memory device is aborted or fails, the MxL86252I defaults to running from the original firmware image in flash memory since there are two images (dual image). The authentication flow is described in the user guide [2].

The supported options for upgrading the firmware image are:

- The firmware is upgradeable over the MDIO slave interface to the flash memory device for MDIO-managed mode.
- When the MxL86252I hosts a web-server as a web-smart switch, the firmware upgrade is done over the web using the webGUI [3].
- In addition firmware download into "empty" flash is supported over MDIO slave interface.

**Attention: The MDIO slave interface for firmware download or upgrade supports IEEE 802.3 Clause 22 only.**

**Attention: The MDIO address for firmware download or upgrade to flash is defined by the pin strapping in Table 18 with the lowest three bits equal to 0.**

**Attention: After the firmware upgrade to the flash memory is completed, the MxL86252I must be rebooted such that the new image is authenticated. The same requirement also applies to flash memory devices that are programmed directly by customers, which do not use the firmware upgrade procedure provided in this section.**

The procedure to download firmware over the MDIO slave interface is documented in [2]. It provides information on the update/download process and which actions are required in the external processor application.

Security features to prevent rollback of the image to a previous version (anti-rollback) and to prevent flash memory wear-out due to frequent updates (flash anti-wear out) are supported within the MxL86252I. The supported features are:

- The MxL86252I verifies that the new firmware has a higher or same security version number (SVN) than the previously installed firmware before executing it. If this step fails due to the firmware SVN being a lower version, the original firmware is executed from the flash memory device since there are two images in the flash memory. If the system does not desire to have this anti-rollback feature, it is possible to disable in the flash configuration. A user guide describing the anti-rollback feature and the configuration option is provided in [2].
- Flash memory components typically support a minimum of 100,000 erase/program cycles, so flash wear-out is unlikely. However, ensuring a minimum interval between flash updates decreases the likelihood of wear-out. If the firmware upgrade is done over the web in a web-smart application, then the MxL86252I is configurable to prevent another firmware update within a certain period of time. For example, when the MxL86252I is configured to insert a wait time of one hour, the minimum time before wearing out the flash memory device becomes longer than 11 years.

However, in a MDIO-managed application, whereby firmware is downloaded to the flash over the slave MDIO interface, the flash anti-wear out feature is not supported by the MxL86252I. The system to which the MxL86252I is attached is expected to ensure that the firmware is only installed when a new firmware is available and does not attempt to install new firmware after every reboot. If the system to which the MxL86252I is attached mandates such features, they must be supported by the system itself.

### 3.16 Web-Smart Processor

The Web-Smart Processor (WSP) is an integrated microcontroller, which is the central control block inside the MxL86252I for features, such as a web-server. This allows the MxL86252I to be configured via a web-browser on an external device like a PC. Certain levels of customization of the user interface are supported to implement the desired functionality and GUI. A demonstration reference GUI to configure all configurable parameters is also available.

There are 3 WSP firmware security options supported:

1. The provided WSP firmware is signed with a MaxLinear key. The web-server customization is only allowed with the use of configuration files. The scope of such customization is limited. Refer to [4] for information on customizing the web-server and refer to [2] for information on signing the customized firmware. Other configurations using FCA [2] are also supported. This is the default option.
2. The WSP firmware is not signed. This is an option for the customers during their firmware development phase. It allows customers to develop their own firmware faster without needing to compile with a signature. However, the final deployed firmware must be signed with the customer's key using the third option. A separate production flash image is provided to enable this feature. Refer to [2] for more information.
3. The WSP firmware is signed with the customer's key. The production flash image is provided for the customer to write the customer's key into the One-Time-Programmable (OTP) memory in MxL86252I. Refer to [2] for more details on customer's key programming.

The WSP has a 64 KB 4-way instruction cache and executes directly from the external firmware memory. It also has an integrated UART interface that allows console support for development.

### 3.17 Switch Fabric Functional Description

This section provides a detailed functional description of the Switch Fabric.

#### 3.17.1 Overview

The Switch Fabric is responsible for classifying, storing, and forwarding multiple data packets. It consists of storage buffer, packet queuing, and packet classification units. Ingress data received on one of the interfaces is classified and placed in the appropriate QoS queue in the shared storage buffer. Ingress policing and access control rules are applied to the received traffic and packets not compliant to the rules are discarded. Before a packet is fetched from the shared memory and transmitted on one or several of the egress interfaces, it is subjected to egress scheduling, rate shaping, and modification.

##### 3.17.1.1 Packet Flow

**Figure 17** describes a packet data flow through various stages of the switch. The flow starts on the top right corner.

**Figure 17 Packet Flow Diagram**

The packet received on the ingress interface is first stripped from the Ethernet Preamble and checked for correct CRC. The behavior when a reception error occurs is programmable. This determines whether the packet is discarded or not.

The received packet is classified in the Packet Classification Engine (PCE). The packet is assigned to one or several appropriate QoS queues, such as broadcast or multicast. The packet classification filtering determines whether the received packet is discarded.

Prior to accepting it to a certain queue, the packet is subject to metering and Weighted Random Early Detection (WRED) functions. Packets marked as non-conforming by the metering engine might be discarded by the WRED algorithm based on the configurable drop precedence.

The scheduling function, Strict Priority (SP) and/or Deficit Weighted Round Robin (DWRR), determines which queue is allowed to emit a packet. Prior to transmission on the egress side, the packet is subject to Rate Shaping. Packets scheduled for transmission are subject to egress specific header modification, such as, MAC address swap, special tag modification, OAM/1588 timer stamp modification, OAM packet counter field modification, DSCP and IP checksum modification, or VLAN tag modification.

### 3.17.1.2 Switch Fabric Control

For applications with MDIO-managed mode of operation, the switch fabric on the MxL86252I is controlled by a switch driver executed on the Host SoC. The control interface is the slave MDIO interface. The same interface is used to configure the PHY MDIO and MMD registers using the switch driver. The switch driver is part of the Host SoC API software documented in the MxL86252I API.

In applications with smart mode of operation, where it is not managed by the Host SoC, the switch is controlled via the webGUI, documented in [\[3\]](#).

In unmanaged mode, the switch fabric is pre-configured using the FCA, documented in [\[2\]](#).

### 3.17.2 Ethernet Bridging

Ethernet bridging, or switching, is the primary task of the switch macro. The frames received on one of the ingress ports must be forwarded to the appropriate destination port. The destination port is determined by a lookup in the MAC bridging table. The MAC bridging table can be populated by software, using static entries, or entries can automatically be learned by the hardware learning function. The entries learned by the hardware can age out after a configurable time and are deleted from the MAC bridging table.

#### 3.17.2.1 Parsing

The switch macro features a parser realized as a microcoded engine. This allows a flexible adaptation to any future protocol changes. The parser microcode evaluates the frame header and is capable of extracting all relevant information up to the layer 4 protocol from the frame. The microcode must be loaded otherwise only the MAC destination and MAC source address is extracted from the frame.

#### 3.17.2.2 MAC Bridging Table

The MAC bridging table is realized as a hash table with four collision buckets and holds these components.

- Lookup key
  - MAC address
  - Forwarding identifier (FID)
  - VLAN tag
- Control information
  - Static indication
  - Aging timer
  - Changed indication
- Result
  - Port or port map
  - Sub-interface ID
  - Associated MAC address

A port map is a bitmap where each bit represents a single port. The port map allows to send the frame to multiple destination ports and is available for static entries only.

The switch macro supports learning, either Shared VLAN Learning (SVL), or Independent VLAN Learning (IVL). It is achieved by mapping the default customer VLAN ID or a flow to an FID used as part of the lookup key, together with the MAC address, for the MAC bridging table lookup. By default, the FID value is zero and all entries belong to SVL.

Entries are entered automatically by hardware using dynamic MAC address learning, or entered by software via manual learning. The software writes static entries into the MAC bridge table, but it is also possible to write dynamic entries which are subject to aging.

The MAC bridge table is able to hold unicast, multicast, or broadcast addresses. The table entries containing multiple egress ports as a destination are entered only as static entries by appropriate management action.

#### 3.17.2.3 Layer 2 Security

The supported layer 2 security features comprise:

- IEEE 802.1X
- MAC learning limitation, allows only a limited number of MAC addresses to be learned on a port.
- MAC port locking and MAC spoofing detection, allows only frames with a previously learned MAC and PortID association.
- MAC table freeze, allows only frames with previously learned MAC addresses.
- Source MAC address filtering and destination MAC address filtering, filters user defined MAC addresses.

### 3.17.2.4 Spanning Tree Protocol Support

The switch macro supports the port states required for the Spanning Tree Protocol (STP) functionality. 16 spanning tree instances per port are supported. Each spanning tree instance is associated with least significant 4 bits of the FID and a port. The port state programmed for one FID does not have effect on the behavior of another FID of the same port.

These states are supported per STP instance:

- **Disabled**  
When disabled, all ingress frames are dropped, the source MAC address is not learned. All egress frames are discarded.
- **Blocking/Listening**  
In this state, all regular ingress and egress traffic is discarded. It is possible for Bridge Protocol Data Unit (BPDU) frames to ignore the port state and be forwarded to the STP managing entity. The source MAC address is not learned in this state.
- **Learning**  
In this state, all regular ingress and egress traffic is discarded. The source MAC address is learned in this state. It is possible for BPDU frames to ignore the port state and be forwarded to the STP managing entity.
- **Forwarding**  
Normal operation. Ingress and egress traffic is enabled for all frames.

### 3.17.2.5 Flow Control Function

To prevent buffer congestion and packet drop, the switch macro supports a flow control mechanism. In full duplex operation the sender is notified to start or stop the transmission via a PAUSE frame based on the IEEE 802.3x standard or a priority pause frame based on the IEEE 802.1Qbb standard. The switch macro is able to transmit or receive and react accordingly to 802.3x/802.1Qbb flow control frames. In half duplex operation, the switch macro supports a back pressure mechanism, specifically, a jam pattern is transmitted on the port forcing a collision. It is possible to enable or disable flow control on a per-port basis. When enabled, it depends on the auto-negotiation result of the attached PHY.

This list shows how flow control is applied:

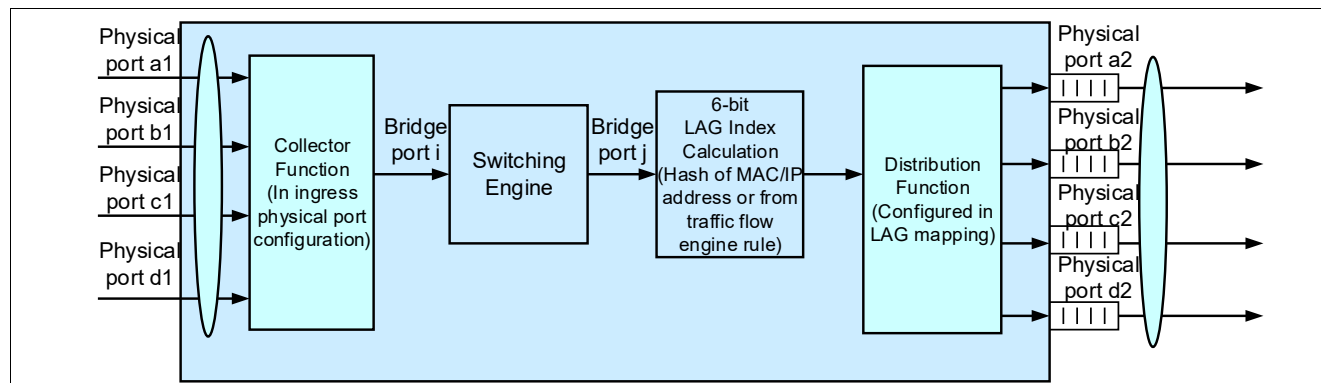

- **Global Flow Control**  
Flow control is activated when the global buffer congestion level exceeds a programmable global threshold and is deactivated when the global buffer congestion level is below a programmable global threshold. Flow control applies to all enabled ports.
- **Ingress Port Congestion-Based Flow Control**  
Flow control is activated when the ingress port local buffer congestion level exceeds a programmable local threshold and deactivated when the local buffer congestion level drops below a programmable local threshold. Flow control applies to each port individually.
- **Ingress Port Metering-Based Flow Control**  
When the global buffer filling level exceeds a programmable global threshold, flow control is activated on the port that exceed the configured ingress rate. When the global buffer filling level drops below a programmable threshold or the traffic rate is reduced below the configured rate, flow control is deactivated on the port. See [Section 3.17.5.4](#) for details regarding the metering based flow control and metering assignment.

### 3.17.2.6 Port Trunking Functions

The switch macro supports link aggregation according to IEEE 802.3ad. Link aggregation (LAG), also called port trunking, allows to combine multiple physical ports to a trunk for high bandwidth inter-switch links. It is possible to combine 64 physical ports to form a trunk, which is also known as a LAG group. There is no restriction on the port sequence or combination which are used for the trunk. When one link is broken or disabled for any reason, such as being powered off, the software or firmware detects and automatically reconfigures the mapping. It is not

possible for hardware to automatically switch to other working links. Up to 32 LAG groups are supported. The number of physical ports in a LAG group is not required to be a power of 2.

**Figure 18** shows how packets received from all ports in a trunk are aggregated and how the packets are distributed to all ports in a trunk.

**Figure 18** Port Trunking Function

### 3.17.3 VLAN Functions

This section describes Virtual Local Area Network (VLAN) bridging functionality.

A VLAN is a grouping of network devices logically segmented by functions or applications without regard to the physical location of the devices. Ports in a VLAN share broadcast traffic and belong to the same broadcast domain. Any traffic in one VLAN is by definition not transmitted outside of that VLAN. However, there are exceptions to this general rule which are configurable to cover certain system requirements.

This section provides more details regarding VLAN functionality.

#### 3.17.3.1 VLAN Association

The VLAN classification function associates each packet received on the ingress side with a specific VLAN group. VLAN association is performed in one of two ways:

- **Implicit VLAN Association**

The VLAN group is based on packet attributes. When the association is based on the ingress port it is called port-based VLAN. When the association is based on the MAC address, it is referred to as a MAC-based VLAN. When the association is based on selected packet header fields, such as Ethernet type, IP protocol, IP address subnet, or MAC address, it is referred to as a protocol-based VLAN.

- **Explicit VLAN Association**

The VLAN group information is carried in a VLAN tag in the Ethernet header of the received packet. This association is referred to as a tag-based VLAN.

#### 3.17.3.2 VLAN QinQ

IEEE 802.1QinQ is an Ethernet networking standard formally known as IEEE 802.1ad and is defined in the amendment IEEE 802.1Q-1998. It is for Ethernet frame formats. The technique is also known as provider bridging, stacked VLANs, QinQ, or Q-in-Q. The idea is to provide, for example, the possibility for customers to run their own VLANs inside service provider's provided VLAN. This allows a service provider to configure a single VLAN for a customer and allowing each customer to treat that VLAN as if it were a trunk.

The original 802.1Q specification allows a single VLAN header to be inserted into an Ethernet frame. QinQ allows multiple VLAN headers to be inserted into a single frame.

In this context, a QinQ frame is a frame that has two VLAN 802.1Q headers, and is referred to as a being double-tagged. A tag stack creates a mechanism for internet service providers to encapsulate customer-tagged 802.1Q traffic with service provider's tag. The final frame is a QinQ frame.

A Service VLAN Tag (STAG) frame is identified by a Tag Protocol ID (TPID), which is typically 88A8<sub>H</sub>, but is programmable, and is followed by two bytes of the Tag Control Information (TCI) field. The TCI field consists of a 3-bit Priority Code Point (PCP) field, a 1-bit Drop Eligible Indicator (DEI) field, and a 12-bit VLAN Identifier (VID) field.

A Customer VLAN Tag (CTAG) frame is identified by a TPID, typically 8100<sub>H</sub>, but is programmable, and is followed by two bytes of the TCI field. The TCI field consists of a 3-bit PCP field, a 1-bit DEI field, and a 12-bit VID field.

VLAN QinQ is supported with the extended VLAN tagging operation.

#### 3.17.3.3 Extended VLAN Tagging Operation

Extended VLAN tagging operation is supported with a 1K entry table. Both symmetrical and asymmetrical ingress and egress tagging is supported, whereby the start and the end entry index are programmable per ingress port and per egress port independently. It is possible to cascade the ingress and egress extended VLAN tagging operation.

There are two parts in each entry: the filtering pattern and the action. The filtering pattern includes VLAN priority, VLAN ID, TPID/DEI of both STAG and CTAG and the Ethertype. It is configurable to base on the intermediate

VLAN tags, after modification in the previous processing stage, or the original ingress VLAN tags, before any modification, per entry.

The actions of the tagging operation corresponding to each matched rule includes the discard/forwarding action, STAG and CTAG removal/insertion/replacement, DSCP remarking, traffic class assignment, bridge port reassignment, metering assignment, mirroring enable/disable, loop-back enable with DA/SA swap.

It is only possible to insert, remove, or replace two VLAN tags. If both an ingress extended VLAN tagging operation and an egress extended VLAN tagging operation are enabled, any configuration which requires the insertion/removal/replace of more than two VLAN tags is illegal.

Discarded packets by ingress extended VLAN tagging operation are trappable by traffic flow classification engine for forwarding. When cross-VLAN is enabled, discard actions by the extended VLAN tagging operation are ignored.

### 3.17.3.4 VLAN Filtering

It is possible to forward or discard a received frame based on the VLAN group configuration and configured port attributes. VLAN filtering is based on the STAG VLAN TCI, after it has been modified in a previous processing stage. The filtering is applicable to all ingress ports, after the ingress extended VLAN tagging operation, and egress ports, before egress extended VLAN tagging operation. Both symmetrical and asymmetrical VLAN filtering are supported.

The VLAN TCI field comprises the VLAN ID, PCP and DEI field. These VLAN filtering mask options are supported in ingress and egress port configuration:

- **VID-Only Mode**  
In VID-only mode, the VLAN ID field is used for VLAN filtering lookup.
- **PCP-Only Mode**  
In PCP-only mode, the PCP field is used for VLAN filtering lookup.
- **TCI Mode**  
In TCI mode, all 16-bit TCI is used for VLAN filtering lookup.

It is possible to configure the VLAN rules to discard or forward VLAN-tagged traffic which does not match any of the three filtering rules. For VLAN untagged traffic, it can be configured to be discarded or forwarded.

It is possible to configure each ingress port to filter according to a list of different TCI or mask patterns. Each egress port supports up to 2 such lists. These lists are sharable between ports and contain up to 1,000 TCI or mask patterns.

### 3.17.3.5 VLAN Transparent Mode

VLAN transparent mode is configurable per ingress port.

If VLAN transparent mode is enabled, VLAN tags at ingress are treated as part of the payload and the packets are considered as untagged.

Several exceptions apply to VLAN transparent mode, they are:

- **Traffic Flow Classification - Ingress VLAN ID**  
Transparent mode is ignored when the pattern field of a VLAN is based on the ingress VLAN ID. The ingress-tagged packets are still considered as tagged packets regardless of transparent mode setting.
- **Traffic Flow Classification - STAG PCP+DEI and CTAG PCP+DEI**  
Transparent mode is ignored when STAG PCP+DEI and CTAG PCP+DEI is based on ingress packets. The ingress-tagged packets are still considered as tagged packets regardless of the transparent mode setting.
- **Traffic Class Mapping**  
PCP+DEI in ingress STAG and PCP in ingress CTAG are used for traffic class mapping regardless of transparent mode setting.

### 3.17.3.6 Cross-VLAN Functionality

Ethernet frames that are classified as cross-VLAN cross the VLAN boundaries. They ignore any of the VLAN filtering modes for the ingress or egress ports, and any discard action in the extended VLAN tagging operation for the ingress or egress ports.

Cross-VLAN classification is performed as part of the traffic flow classification function.

### 3.17.4 Multicast Forwarding Functions

Multicast forwarding is a method of forwarding Ethernet frames or IP datagrams to a group of receivers. A basic Ethernet switch floods all received multicast frames to all output ports even when no host on a port is interested in that particular multicast stream. This waste of bandwidth is avoided by the sophisticated multicast handling of the switch macro which allows the forwarding of multicast frames based on layer 2 or layer 3 addresses to dedicated ports. In addition, the switch macro is able to learn layer 3 multicast group addresses via IGMPv1/2/3 and MLDv1/2 snooping.

#### 3.17.4.1 Layer 2 Multicast Forwarding

The layer 2 multicast forwarding function deals with multicast frame forwarding based on the Ethernet MAC address. The destination port map is looked up in the bridging table. The multicast addresses are not added to the bridging table by automatic learning function and must be configured manually, by an appropriate management action. The associated port map contains all the relevant port members. When the destination MAC address of the received frame matches the entry in the bridging table and the forwarding mode is layer 2 only or there was no match in the layer 3 multicast table, or the packet is non-IP multicast, the frame is delivered to all the destinations specified in the associated port map.

#### 3.17.4.2 Layer 3 Multicast Forwarding

The layer 3 multicast function deals with multicast frame forwarding based on the IPv4 or IPv6 network address. The destination port map is looked up in the layer 3 multicast table.

The lookup in the multicast table is performed using the destination IPv4/IPv6 address, the source IPv4/IPv6 address, and FID. The addresses in the table are added by an appropriate management action.

#### 3.17.4.3 IGMP and MLD Snooping

The switch macro supports Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) snooping. IGMP/MLD snooping is designed to prevent hosts on a local network from receiving traffic for a multicast group they have not explicitly joined. It provides a mechanism to prune multicast traffic from links that do not contain a multicast listener, which is an IGMP/MLD group member. IGMP/MLD snooping requires the switch macro to examine, or snoop, some layer 3 information in the IGMP/MLD packets sent between the hosts and the router. In addition, adjacent routers also use these protocols to communicate and share routing information. It is also possible to snoop the exchange information to identify the multicast router port.

The switch macro supports software-based IGMP/MLD snooping mode for the IGMPv1/2/3 or MLDv1/2 protocols. In this mode, specific IGMP/MLD reports can be intercepted by the switch and delivered to the CPU or network processor port. The reports are analyzed by the CPU and the layer 3 multicast table is populated by the software with appropriate source or destination addresses.

### 3.17.5 Quality of Service Functions

The switch macro provides extensive support for Quality of Service functionality. Traffic class assignment based on multiple flow parameters, ingress traffic policing, multiple egress queues per port with strict or WFQ scheduling, traffic shaping, and Weighted Random Early Detection (WRED) functions are supported.

This section describes the QoS functions supported by the switch.

#### 3.17.5.1 Class of Service Assignment

The switch macro supports classification of the incoming traffic into traffic classes or classes of service (CoS). It is possible to manage each traffic class differently, be it remarked, policed, or shaped, ensuring preferential treatment for higher-priority traffic on the network. Supported RFCs include RFC2474 and RFC2597.

Up to 16 different traffic classes are supported and mapped individually to appropriate QoS queue. See [Section 3.17.5.3](#) for more details regarding queue mapping.

#### 3.17.5.2 Remarking Function

The switch macro supports the remarking of the Differentiated Services Code Point (DSCP), the (re)generation of the STAG PCP&DEI, and the (re)generation of the CTAG PCP&DEI in the egress frame. The modification of the code points in the outgoing packets is based on both traffic class and egress port. The switch macro provides a dedicated mapping table to assign the new DSCP, CTAG PCP&DEI, and STAG PCP&DEI according to traffic class, as well as the egress port. [Figure 19](#) shows how to remark DSCP, including drop precedence, CTAG PCP, CTAG DEI, STAG PCP, and STAG DEI based on any of the class of service assignment parameters.

Remarking is enabled on a per ingress port basis. It is also possible to disable remarking on a per egress port and per code point basis. In addition, the traffic flow table allows disabling remarking explicitly for certain flows.

**Figure 19 PCP/DSCP/DEI Remarking**

### 3.17.5.3 Queue Mapping

The switch macro supports 128 egress QoS queues which are flexibly assignable to egress ports and traffic classes. For each egress physical port, up to 16 priority queues are assignable. This section provides more details about the queue mapping functionality.

#### Queue to Port Mapping

By default, each egress port has 8 QoS queues. Depending upon application, it might be desirable to have a different number of QoS queues on specific ports. The switch macro supports flexible queue to port mapping, assuming that the queues assigned to one egress physical port are consecutive and the total number of queues per port do not exceed 16. This way the default configuration can be changed so that one port, for example, contains 16 queues.

In addition, an active port must have at least one queue and can have maximum 16 queues assigned to it.

#### Port, Traffic Class to Queue Mapping

Incoming frames are being stored in the appropriate queues based on the egress port and the traffic class assignment. The mapping of the traffic class to queue is specified in a dedicated queue mapping table per egress port. The mapping of the traffic classes to queues is related to the number of the queues available on a certain port. For example, on one port, four traffic classes are mappable to four different queues, while on another port, all four traffic classes are mappable to one single queue.

### 3.17.5.4 Rate Metering

The switch macro supports 128 instances of a Two Rate Three Color Marker (trTCM) rate metering. Each marker or meter measures the rate of a packet stream and marks the packets as green, yellow, or red. When there is no metering instance assigned to a traffic stream, the stream is considered to be green and in color-blind mode. In color-aware mode, the stream is colored based on the drop precedence encoded in the frame.

It is possible to use the color markings later for policing in the active congestion management function, see [Section 3.17.5.7](#) for details. In addition, the markings are usable to remark the drop precedence of the outgoing packet in the DSCP and STAG DEI.

The supported metering algorithm in Single Rate Three Color Marker (srTCM) is defined in RFC2697. The supported metering algorithm in trTCM are the non-coupling mode as defined in RFC4115 and the coupling mode as defined in the Metro Ethernet Forum (MEF). It is only possible to assign a single meter instance to measure the rate of a traffic flow.

#### Critical Frames

Frames are classified as critical based on a rule configured in the traffic flow table. Critical frames bypass the metering instance and do not trigger the active congestion management function.

#### Color-aware and Color-blind Modes

The switch macro supports color-awareness modes which are configurable per ingress port. In color-aware mode, the meter assumes that some preceding entity has pre-colored the incoming packet stream so that each packet is either green, yellow, or red. The ingress color of the incoming frame is based on either DSCP value or STAG PCP&DEI value. It is retrieved from the appropriate DSCP mapping table or STAG PCP&DEI mapping table. Non-IP and non-STAG packets are treated as pre-colored to green.

In color-blind mode, all packets are treated as green.

#### DSCP Drop Precedence Remarking

DSCP drop precedence remarking is enableable in both the ingress port configuration and the egress port configuration by replacing the lower three bits of the received DSCP field with the value of appropriate color

decided by the metering instance for the received packet. The mapping of the color to the lower three bits of the DSCP is configurable per egress port. See [Section 3.17.5.2](#) for details.

### DEI (Re)generation

DEI regeneration is enabled by both ingress port and egress port configuration to reflect the metering result by setting the STAG DEI field of the packet with the value of appropriate color decided by the metering instance for the received packet. The mapping of the color to the DEI is configured per egress port. See [Section 3.17.5.2](#) for details.

### Metering-based Flow Control

When a metering instance is assigned to an ingress port, the conformance rate of the port is usable for triggering flow control. See [Section 3.17.2.5](#) for details.

### 3.17.5.5 Rate Shaping

The switch macro supports 128 instances of rate shaper instances. Each rate shaper is configurable to either token bucket mode or credit rate shaper mode. Each shaper measures the rate of an egress queue and prevent the queues which exceeded the configured rate from being scheduled for the next packet transmission. Shaping is based on a Committed Information Rate (CIR) and an associated Committed Burst Size (CBS). A queue is selectable for transmission only when it does not exceed the CBS for a given CIR.

Up to two shaping instances can be assigned to measure the egress rate of a specific queue or number of queues. Two shapers are typically assigned to measure the peak and committed rate and typically have different CIR settings. It is possible for any number of queues to share the same shaping instance. In this situation, the committed rate and the burst size are shared among the assigned queues.

When there is no shaper assigned to a queue, the queue rate is not monitored. MaxLinear recommends assigning a shaper for queues with high scheduling weights or strict priority queues. See [Section 3.17.5.6](#) for details regarding queue scheduling.

### 3.17.5.6 Queue Scheduling

The scheduling function determines which queue is allowed to emit a packet. Queue scheduling is done after rate shaping. The switch macro supports these scheduling types for each one of the 128 egress QoS queues:

- **Weighted Fair Queueing (WFQ)**  
For a given port, packets in the WFQ queues are scheduled for transmission in accordance with their configured weight. The weight represents a ratio for transmission. The higher the weight of one queue compared to another, the more this queue is scheduled for transmission.  
For example, a queue with a weight of 4000 is served twice as often than a queue with a weight of 2000.
- **Strict High Priority**  
For a given port, packets in the strict high priority queue are scheduled for transmission before any packet in the WFQ queue. When there are multiple strict high priority queues configured for a port, the queues with a higher physical number are scheduled first.
- **Strict Low Priority**  
For a given port, packets in the strict low priority queue are scheduled for transmission after any packet in the WFQ queue. When there are multiple strict low priority queues configured for a port, the queues with a higher physical number are scheduled first.

### 3.17.5.7 Congestion Management

The switch macro provides protection for the internal buffer from congestion and overflow.

When the shared buffer is fully occupied and does not have enough resources to receive any new frame, the incoming frames on all ports are discarded, until the congestion condition is relieved. See [Section 3.17.2.5](#) for flow control activation.

The switch macro also provides two segment thresholds per color globally and per color per egress queue. For every incoming packet, a decision is made whether to enqueue it or not, which is based on the configured thresholds of the respective packet color, and the global, port or queue segment filling level. This protection mechanism is called Active Congestion Management (ACM).

The color of the packets is decided based on the conformance rate in the metering instance. See [Section 3.17.5.4](#) for details. The thresholds are checked with accordance to the incoming packet color. For example, red thresholds apply to red-colored packets, yellow for yellow-colored packets, and green for green-colored packets.

The switch macro is able to reserve a buffer per egress queue. This allows the protection of queues against congestion caused by other queues and ports. It provides a minimum buffer guarantee for each queue. A green frame is permitted to bypass ACM and is always accepted by the queue when the reserved buffer threshold of the queue is not exceeded.

Critical frames bypass the ACM and are enqueued regardless of the filling level. Critical frames are not enqueued only in case of a buffer full event or a packet pointer full event.

The ACM function discards the frames early, before the buffer full event, with a certain drop probability. ACM thresholds provide three functionalities:

- **Minimum (MIN) Threshold**  
When the filling level of the queue is below this threshold, excluding the threshold value, the packet with the appropriate color is not discarded and is enqueued.
- **Maximum (MAX) Threshold**  
When the filling level of the queue is above this threshold, excluding the threshold value, the packet with the appropriate color is discarded.
- **$\frac{1}{2}(\text{Maximum-Minimum})$   $\frac{1}{2}(\text{MAX-MIN})$  Threshold**  
When the filling level of the queue is between the MIN and MAX thresholds, the packet is discarded with certain probability. The drop probability profile is selectable globally between 25%, 50% and 75%. When the filling level is below half the distance between the minimum and maximum thresholds, the packet is discarded with a lower probability ( $P_{\min}$ ), when the filling level is above half the distance between the minimum and maximum thresholds, the packet is discarded with a higher probability ( $P_{\max}$ ).

### 3.17.5.8 Egress Queue Congestion Notification

802.1Qau operates in the link layer to provide a means for a bridge to notify a source of congestion allowing the source to reduce the flow rate.

In switch macro, the congestion level of each egress queue is monitored. If the congestion level is greater than 1/4 of green maximum threshold, congestion status of the egress queue is set to 1. If the congestion level is lower than 1/4 of green minimum threshold, congestion status of the egress queue is cleared to 0.

### 3.17.5.9 Storm Control

The switch macro supports a broadcast storm control function. A broadcast storm is defined as an excessive amount of broadcast, multicast, or unknown unicast Ethernet frames received on a switch port. Due to the massive replication of data frames, broadcast storms significantly degrade the system performance. Intentional broadcast storms are a form of Denial-of-Service (DoS) attack.

The storm control function effectively polices specific traffic type and protect the resources from being flooded by broadcast traffic.

The selected metering instance is configured to the required policed rate of the broadcast storm. Several traffic types are selectable for the storm control function:

- Broadcast frames

- Unknown multicast frames
- Unknown unicast frames

When the rate of the selected frame types exceeds the rate configured in the meter instance, the frames are marked as either yellow or red. When the active congestion management thresholds are configured appropriately, the storm frames are discarded.

### 3.17.6 Flow Classification Function

The switch macro includes a powerful packet classification engine which performs multi-field classifications based on up to 512 programmable rules.

#### Traffic Flow Table

The traffic flow table contains up to 512 programmable rules. Rules are configurable per ingress port, but are also sharable between ports. Each rule consists of a pattern section and an action section. A pattern specifies certain combination of packet header fields. The parser extracts the packet header fields from the received packet and provides them to the traffic flow table. When a pattern matches, the enabled actions apply. The pattern search continues until all actions are satisfied. This allows the definition of multiple pattern for different actions. It is possible to enable or disable an action for a given pattern.

The location of a rule in the table defines its priority. A rule with a lower index number has higher priority. The traffic flow table is searched using pattern matching and action matching.

- **Pattern Match:**

A pattern row is considered matched when all of the fields in the pattern have been matched, not matched, or configured to be ignored. When a pattern row matches, the appropriate action row is checked for that pattern.

*Note: It is possible for multiple pattern rows in a table to match the search, but only the first pattern in the table matched for certain action is applied.*

The supported patterns include the source port information, packet length, and multiple L2/L3/L4/L4+ packet fields.

- **Action Match:**

Each action in the action row can be enabled or disabled for certain pattern row match. When the action is enabled and the pattern row matched, this action is applied for the classified packet. The search in the table terminates only when all the actions in the action section have been found. When not, the search continues for the next pattern match and the corresponding action match. An additional option is to enable the action and to select a default behavior for that action, in other words, the search for another enabled action is terminated.

*Note: For a given packet classification only one pattern may match one specific action, however, multiple patterns may match multiple different actions, in other words, the action section is searched independently for each action type.*

The supported actions include destination port(s) assignment (including discard option), port filtering, traffic class assignment, traffic meter assignment, extended VLAN tagging operation assignment, flow counter assignment, OAM handling assignment, cross VLAN policy, cross state policy, color assignment, Link Aggregation Group (LAG) assignment, L2 MAC address learning policy, and interrupt policy.

### 3.17.7 Operation, Administration, and Management Functions

This section summarizes the functions provided to control and monitor the data traffic through the switch.

#### 3.17.7.1 Monitoring Counters

Multiple counters are provided per port to monitor incoming and outgoing data traffic as well as errors or special events. Each port provides the same set of counters. The groups of counters are:

- A set of standard Ethernet counters, also known as RMON counters in RFC2819.
- A group of counters assigned to programmable traffic flows.
- A group of counters for metering.
- A group of counters for MAC learning discard events.

#### 3.17.7.2 Port Mirroring

The switch macro supports port monitoring and port redirection to assist in system debugging or to enable a software-controlled functionality. The data received on a selected port may be mirrored or redirected to another selected port (the monitoring port).

##### Mirroring Function

Ingress mirroring means the received frame is processed and forwarded as normal, but a copy of that frame is in addition sent to the monitoring port.

Egress mirroring means that the transmitted frame is forwarded as normal, but a copy of that egress frame (with modification) is in addition sent to the monitoring port.

The options given by the port mirroring function are:

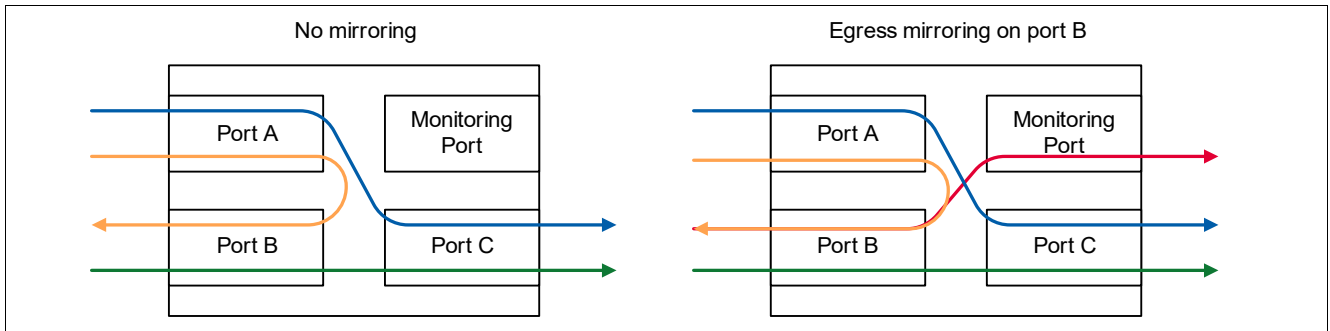

- Copy data received on a selected port to the monitoring port.
- Copy data received on a selected group of ports to the monitoring port.
- Copy data transmitted on a selected port to the monitoring port.
- Copy data transmitted on a selected group of ports to the monitoring port.
- Copy data received or transmitted on a selected port to the monitoring port.
- Copy data received or transmitted on a selected group of ports to the monitoring port.

**Figure 20** and **Figure 21** provide illustrations on the ingress and egress monitoring.

**Figure 20 Port Mirroring Examples – Ingress Monitoring**

**Figure 21 Port Mirroring Examples – Egress Monitoring**

Mirroring is also usable to create diagnostic loopbacks, when the ingress port is identical to the monitoring port.

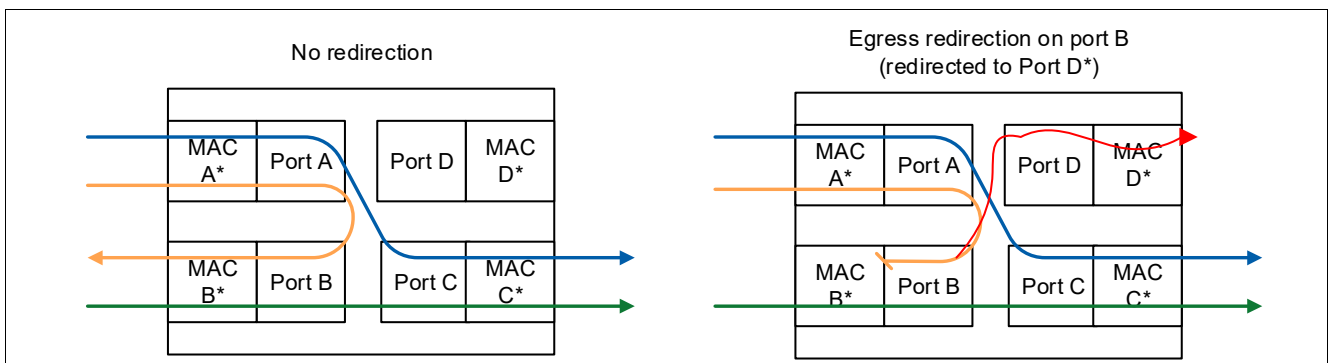

### Error Monitoring

The mirroring function is used to monitor frames otherwise dropped due to reception errors, packet filtering, or violation of certain classification rules. In this case, the received frame is only delivered to the monitoring port and not to the target egress port defined in the egress port map.

It is possible to explicitly enable error monitoring for frames which contain MAC errors or when the MTU has been exceeded.

### Egress Redirection Function

Egress redirection means that the received frame is processed but not forwarded as normal. Instead, that frame is sent to another MAC. [Figure 22](#) provides an illustration. The figure shows an egress traffic port B, which is the destination port, redirected to port D, the redirection port. Egress traffic is counted in port B's transmit counters. Egress packets are treated according to the configuration for port B.

**Figure 22 Port Redirection Examples – Egress Redirection**

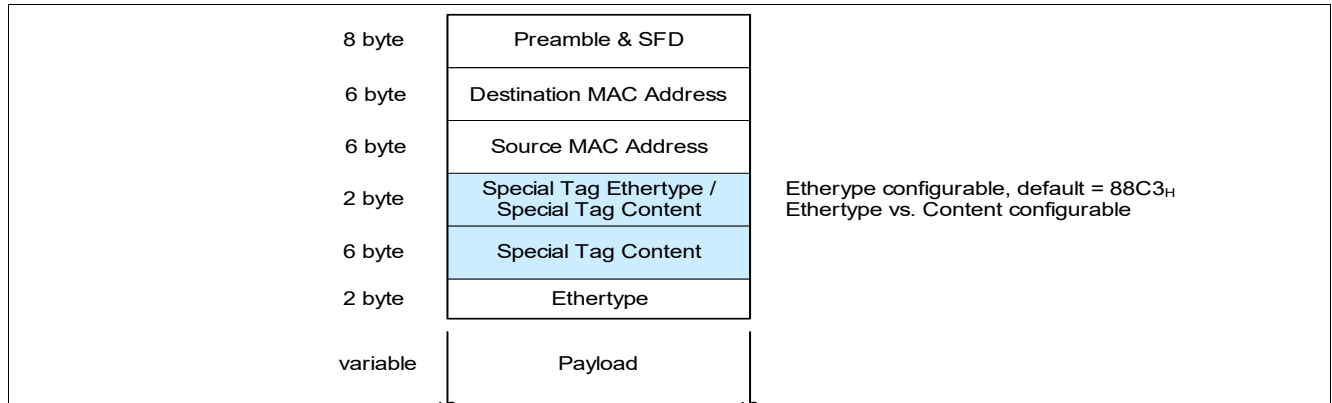

### 3.17.7.3 Special Tag Functionality

The special tag is used to override the forwarding and QoS functionality of the switch on the ingress side and to provide additional frame-status information on the egress side.

The special tag is identified by the special Ethertype field located after the source MAC address in the Ethernet frame. This allows the transmission of the frame via an Ethernet network to a remote receiver. The special tag content has a fixed length of 6 bytes. For internal communication or point-to-point communication it can be configured per egress port when the frame contains additional content in place of the Ethertype. This option is only available at egress direction, in ingress direction always an Ethertype is expected. See [Figure 23](#).

The pause frames generated by the MAC do not contain a special tag. This may result in a mix of frames with and without a special tag on one egress port. Frames with a special tag which do not use the special Ethertype are

distinguishable from pause frames because pause frames have an Ethertype of 0x8808 while the first nibble after the MAC addresses is 0 for frames with a special tag.

**Figure 23 Special Tag Location in the Frame**

*Note: The special tag is used on the CPU port of the switch.*

The content format of the special tag is different for the ingress and the egress.

### Ingress Special Tag

The ingress special tag is used to override the classification function and the default frame forwarding of the switch. Special tag detection on ingress is enabled or disabled per port. When the detection is disabled, the frame containing a special tag is treated as regular frame and the content of the frame is ignored.

When the ingress special tag detection is enabled, the content of the tag is used for the frame forwarding decision. The ingress special tag must always have a special tag Ethertype. See [Table 27](#) for details.

**Table 27 Special Tag Ingress Format**

Byte	Bit	Description
0	[7:0]	<b>Ethertype MSB</b> Byte 1 Configurable. Default 88 <sub>H</sub> .
1	[7:0]	<b>Ethertype LSB</b> Byte 2 Configurable. Default C3 <sub>H</sub> .
2	[7]	<b>Reserved</b> Reserved. This field is not used internally by the switch.
2	[6:4]	<b>Sub-interface ID [14:12]</b> See the Sub-interface ID portions of this table for a description.
2	[3:0]	<b>Traffic Class</b> Target traffic class. This field is valid only when traffic class enable is set
3	[7]	<b>Pre-L2: Bit 1</b> See below for description of Pre-L2 size.
3	[6]	<b>OAM Flag (OAM)</b> This is OAM packet (Delay measurement and loss measurement packet) 0 <sub>B</sub> <b>Disable</b> Not OAM packet 1 <sub>B</sub> <b>Enable</b> OAM packet

**Table 27 Special Tag Ingress Format (cont'd)**

Byte	Bit	Description
3	[5]	<b>Forced Learning Disable (LNMD)</b> Forced leaning disable control 0 <sub>B</sub> <b>Ignore</b> Leaning enable or disable is determined by the switch configurations 1 <sub>B</sub> <b>Disable</b> Learning is forced to be disabled regardless of the switch configurations.
3	[4]	<b>Traffic Class Enable (TC_EN)</b> Traffic class enable 0 <sub>B</sub> <b>Ignore</b> traffic class is determined by the switch configurations. 1 <sub>B</sub> <b>Enable</b> traffic class is determined in special tag traffic class field.
3	[3]	<b>Insertion Flag (INS)</b> This is special packet (For example, Ethernet OAM or IGMP packets) and is inserted by CPU to the data path 0 <sub>B</sub> <b>Disable</b> Not insertion packet 1 <sub>B</sub> <b>Enable</b> Insertion packet.
3	[2]	<b>Extraction Flag (EXT)</b> This is special packet (For example, Ethernet OAM or IGMP packets) and is extracted to CPU from the data path 0 <sub>B</sub> <b>Disable</b> Not extracted packet 1 <sub>B</sub> <b>Enable</b> Extracted packet.
3	[1:0]	<b>Packet Type (PKT_TYPE)</b> 00 <sub>B</sub> <b>Ether</b> Ethernet packet 10 <sub>B</sub> <b>802.11</b> 802.11 format X1 <sub>B</sub> <b>Reserved</b> Reserved.
4	[7]	<b>Pre-L2: Bit 0</b> Pre-L2 size in special tag does not include PMAC header and special tag. Pre-L2 size in packet descriptor includes PMAC header. 00 <sub>B</sub> <b>NIL</b> No Pre-L2 header 01 <sub>B</sub> <b>16B</b> 16B Pre-L2 header 10 <sub>B</sub> <b>32B</b> 32B Pre-L2 header 11 <sub>B</sub> <b>48</b> 48B Pre-L2 header
4	[6]	<b>One Step Time Stamp Flag (One_Step)</b> This packet is one step time stamp packet and hardware is not required to capture and store the transmit time stamp. 0 <sub>B</sub> <b>Disable</b> Two step, need to capture and store the transmit time stamp. 1 <sub>B</sub> <b>Enable</b> One step, does not need to store the transmit time stamp.
4	[5]	<b>Time Stamp Flag (PTP)</b> This packet marks if a packet is a PTP message which triggers the time recording of the packet. 0 <sub>B</sub> <b>Disable</b> Not time stamp event packet 1 <sub>B</sub> <b>Enable</b> Time stamp event packet
4	[4]	<b>Sub-interface ID [15]</b> See below for description of sub-interface ID.
4	[3:0]	<b>Sub-interface ID [11:8]</b> See below for description of sub-interface ID.

**Table 27 Special Tag Ingress Format (cont'd)**

Byte	Bit	Description
5	[7:0]	<b>Sub-Interface ID [7:0]</b> For ingress special tag For packet with “Egress= 0” & “INS=1”, it carries source sub-interface ID. For packet with “Egress = 0” & “INS=0”, it carries source sub-interface ID. For packet with “Egress = 1” & “EXT=0”, it carries destination sub-interface ID. For packet with “Egress = 1” & “EXT=1”, it carries source sub-interface ID. For egress special tag: For “EXT=0”, it carries destination sub-interface ID. For “EXT=1”, it carries source sub-interface ID.
6	[7:0]	<b>Record ID [11:4]</b> It is used for logging information for PTP and OAM packets
7	[7:4]	<b>Record ID [3:0]</b> It is used for logging information for PTP and OAM packets
7	[3:0]	<b>Source or Destination Logical Port ID (IGP/EGP)</b> For ingress special tag: For packet with “Egress= 0” & “INS=1”, it carries source LPID. For packet with “Egress = 0” & “INS=0”, it carries source LPID. For packet with “Egress = 1” & “EXT=0”, it carries destination LPID. For packet with “Egress = 1” & “EXT=0”, it carries source LPID. For egress special tag For “EXT=0”, it carries destination LPID. For “EXT=1”, it carries source LPID.

*Note: Bytes are defined as MSB = bit 7 and LSB = bit 0.*

**Table 28** describes the encoding of the traffic class enable fields of the special tag content.

**Table 28 Traffic Class Map Coding**

Traffic Class Enable	Resulting Traffic Class
0	The traffic class is based on the classification result in switch.
1	The traffic class is taken from the special tag (classified traffic class ignored).

An additional *Force No Learning* action flag is available in the ingress special tag. This action disables the learning of the source MAC address of the received frame in the MAC bridging table.

The special tag detected on the ingress side is not delivered to the egress side. The tag is removed prior to transmission.

### Egress Special Tag

The egress special tag contains the status and debug information of the switch. Special tag transmission on egress is enabled or disabled per egress port. When egress special tag is disabled, no special tag is inserted in the egress frame. When egress special tag function is enabled, each egress frame transmitted on that port contains the special tag.

See **Table 29** for more details regarding the egress special tag format.

*Note: Bytes are defined as MSB = bit 7 and LSB = bit 0.*

**Table 29 Special Tag Egress Format**

Byte	Bit	Description
0	[7:0]	<b>Ethertype</b> Byte 1 Configurable. Default 88 <sub>H</sub>
1	[7:0]	<b>Ethertype</b> Byte 2 Configurable. Default: C3 <sub>H</sub>
2	[7]	<b>Reserved</b> Reserved. This field is not used internally by the switch.
2	[6:4]	<b>Sub-interface ID [14:12]</b> See below for description of sub-interface ID.
2	[3:0]	<b>Traffic Class</b> Traffic class of the packet determined by the switch QoS classification.
3	[7]	<b>Pre-L2: Bit 1</b> See below for description of Pre-L2 size.
3	[6]	<b>OAM Flag (OAM)</b> This is OAM packet (Delay measurement and loss measurement packet) 0 <sub>B</sub> <b>Disable</b> Not OAM packet 1 <sub>B</sub> <b>Enable</b> OAM packet
3	[5]	<b>Reserved</b> This field is fixed to 0.
3	[4]	<b>Reserved</b> This field is fixed to 0.
3	[3]	<b>Insertion Flag (INS)</b> This is special packet (For example, Ethernet OAM or IGMP packets) and is inserted by CPU to the data path. 0 <sub>B</sub> <b>Disable</b> Not insertion packet 1 <sub>B</sub> <b>Enable</b> Insertion packet
3	[2]	<b>Extraction Flag (EXT)</b> This is special packet (For example, Ethernet OAM or IGMP packets) and is extracted to CPU from the data path. 0 <sub>B</sub> <b>Disable</b> Not extracted packet 1 <sub>B</sub> <b>Enable</b> Extracted packet
3	[1:0]	<b>Packet Type (PKT_TYPE)</b> 00 <sub>B</sub> <b>Ether</b> Ethernet packet 10 <sub>B</sub> <b>802.11</b> 802.11 format X1 <sub>B</sub> <b>Reserved</b> Reserved.
4	[7]	<b>OAM Flag (OAM)</b> This is OAM packet (Delay measurement and loss measurement packet) 0 <sub>B</sub> <b>Disable</b> Not special OAM packet 1 <sub>B</sub> <b>Enable</b> Special OAM packet

**Table 29 Special Tag Egress Format**

Byte	Bit	Description
4	[6]	<b>One Step Time Stamp Flag (One_Step)</b> This packet is one step time stamp packet and hardware is not required to capture and store the transmit time stamp. 0 <sub>B</sub> <b>Disable</b> Two step, need to capture and store the transmit time stamp. 1 <sub>B</sub> <b>Enable</b> One step, does not need to store the transmit time stamp.
4	[5]	<b>Time Stamp Flag (PTP)</b> This packet marks if a packet is a PTP message which triggers the time recording of the packet. 0 <sub>B</sub> <b>Disable</b> Not time stamp event packet 1 <sub>B</sub> <b>Enable</b> Time stamp event packet
4	[4]	<b>Sub-interface ID [15]</b> See below for description of sub-interface ID.
4	[3:0]	<b>Sub-interface ID [11:8]</b> See below for description of sub-interface ID.
5	[7:0]	<b>Sub-Interface ID [7:0]</b> For “EXT=0”, it carries destination sub-interface ID. For “EXT=1”, it carries source sub-interface ID.
6	[7:0]	<b>Record ID MSB bit 11 to 4.</b> It is used for logging information for PTP and OAM packets
7	[7:4]	<b>Record ID MSB bit 3 to 0.</b> It is used for logging information for PTP and OAM packets
7	[3:0]	<b>Source or Destination Logical Port ID (IGP/EGP)</b> For “EXT=0”, it carries destination logical port ID. For “EXT=1”, it carries source logical port ID.

### 3.17.7.4 Loop Detection

The loop detection feature detects a loop in the network and triggers an alarm, which is usually indicated by an LED. It does not prevent the loop like STP, so a network administrator must be able to clearly see the alarm and resolve the loop by manual means. The violating ports are not disabled by means of any protocol.

## 4 MDIO and MMD Register Interface Description

This chapter describes the MDIO and MMD registers available to support the MxL86252I feature set. These registers are accessible by an external management entity (called STA in IEEE) to control, configure, or read the status of the MxL86252I. After power-on, the MxL86252I resets the MDIO and MMD registers to default values sufficient to operate without specific programming.

All the register definitions, behaviors, and fields are strictly compliant with IEEE 802.3. Refer to IEEE 802.3 [6] for more information about the registers. The only registers not referenced in IEEE 802.3 are two register groups that are vendor-specific: VSPEC1 and VSPEC2. These allow custom functions related to MxL86252I.

In the register descriptions, the section or table references refer to the IEEE 802.3 [6].

### 4.1 MDIO-specific Terminology

This list describes how the common IEEE 802.3 terms relate to MDIO and MMD register concepts discussed in this chapter.

- **STA:** Station Management. A host connected to the MDIO interface. STAs are generally Media Access Controllers (MACs). The STA drives the MDIO bus as a clock master and the MxL86252I is an MDIO slave.
- **Host:** Used as a synonym of STA in this document.
- **PHY:** Physical Layer. In the MxL86252I, this encompasses Analog Signal Processing, Digital Signal Processing, and Physical Coding Sublayer (PCS). The PHY contains several sublayers that are individually manageable entities known as MDIO manageable devices (MMDs).
- **MMD:** MDIO Manageable Device. The list of MMDs available in the MxL86252I is in [Section 4.3](#).
- **Device:** In the context of the MDIO/MMD registers, a device is a register bank grouped by logical sublayers of the PHY layer.
- **Clause:** Refers to a particular section of the IEEE 802.3 standard [6]. In particular, Clause 22 describes MDIO device 0 and Clause 45 describes the other MMDs.
- **MII:** Media Independent Interface. This encompasses the MDIO and the (G)MII as described in Clause 22. STD registers in device 0 are also called MII registers.

## **4.2 Register Naming and Numbering**

The register numbering convention in this document is similar to that of IEEE 802.3.

The numbering syntax uses three numbers, a.b.c, as specified in IEEE 802.3, paragraph 45.1 [6], and the notation is generalized to Clause 22 registers in device 0 STD. The alphanumeric syntax also uses the same structure and uses the names of the MMD devices, registers, and register fields separated by underscores and dots.

### **4.2.1 Register Numbering**

The syntax is as follows, with a, b, and c written as decimal numbers:

a.b.c = <DEVICE\_NUMBER>.<REGISTER\_NUMBER>.<FIELD\_NUMBER>

When the last indicator (c) is omitted, the register numbering refers to the full register.

When a field is more than a single bit, the bit range is indicated using a colon (for example, 1:3 is the field of bits 1 to 3). In an MDIO register, the least significant bit is bit 0 and most significant bit is bit 15. All MDIO registers are 16-bit wide.

### **4.2.2 Register Naming**

The syntax is as follows, with AA, BB, and CC written as alphanumeric strings:

AA\_BB.CC = <DEVICE\_NAME>\_<REGISTER\_NAME>.<FIELD\_NAME>

When the last indicator (CC) is omitted, the register naming refers to the full register.

The fields named RES, RES1, and RES2 refer to reserved fields as per IEEE 802.3.

### **4.2.3 Examples**

STD\_STAT.ANOK is the name of the field 0.1.5, which indicates that auto-negotiation is complete.

ANEG\_CTRL.ANEG\_RESTART is the name of the field 7.0.9, which allows the STA to restart the Ethernet ANEG procedure.

ANEG\_PHYID1 is the complete 16-bit register number 7.2, for the PHY identifier 1 number.

VSPEC1\_LED1.BLINKS is the 4-bit wide field number 30.2.15:12, which contains LED1 slow blinking configuration.

### 4.3 MMD Devices Present in MxL86252I

The MMD devices implement groups of standardized registers under the management of the STA.

**Table 30 MDIO/MMD Devices Present in MxL86252I**

MDIO/MMD Name	Device Number (decimal)	Description
STD	0	MDIO Standard Device as described in Clause 22. This also contains a number of MxL86252I-specific PHY registers.
PMAPMD	1	Control and status registers related to the PMA/PMD signal processing modules
PCS	3	Control and status registers related to the PCS encoding/decoding device
ANEG	7	Control and status registers related to the auto-negotiation device
VSPEC1	30	MxL86252I-specific LED control and other MxL86252I-specific control
VSPEC2	31	MxL86252I-specific WoL control

#### **4.4 Responsibilities of the STA**

The MxL86252I responds to all published register addresses for the device and returns a value of zero for undefined and unsupported registers.

In accordance with IEEE 802.3 guidelines, it is the responsibility of the STA entity to ensure that mutually acceptable speeds are applied consistently across all the MMDs of the MxL86252I.

The MxL86252I ignores writes to the PMA/PMD speed selection bits that select speeds not advertised in the PMA/PMD speed ability register. The PMA/PMD speed selection defaults to a supported ability.

API is provided to access the PHY MDIO and MMD registers, which cannot be accessed directly.

## 4.5 MDIO Access Protocols to Read / Write Registers

All the MDIO/MMD registers are accessible from an external chip connected to the MDIO bus on the MDIO\_S and MDC\_S pins. The MxL86252I supports several MDIO frame protocols:

- Clause 22: To access Device 0
- Clause 22 Extended: To access other devices using the indirection scheme specified by IEEE 802.3
  - Dev 1: PMAPMD
  - Dev 3: PCS
  - Dev 7: ANEG
  - Dev 30: VSPEC1
  - Dev 31: VSPEC2
- Clause 45: to access all devices

Both Clause 22 Extended and Clause 45 are used to access MMD devices. However, the mechanism implemented in the MxL86252I provides faster speeds using Clause 45. It creates differences in latencies in the MDIO reply:

- The Clause 22 Extended protocol involves an indirect mechanism.
- The Clause 45 protocol provides faster replies.

The Clause 22 registers are accessed using the Clause 45 electrical interface and the Clause 22 management frame structure. Refer to IEEE 802.3 section 45 [\[6\]](#).

## 5 PHY MDIO Registers Detailed Description

**Table 31 Register Access Type**

Mode	Symbol
Read-Only Register (Status or Ability Register)	RO
Read-Write Register (MDIO Register)	RW
Read-Write Self-Clearing Register (bit cleared after read from MDIO)	RWSC
Read-Only Self-Clearing Register (bit cleared after read from MDIO)	ROSC
Read-Only Latching Low Register	ROLL
Read-Only Latching High Register	ROLH

## 5.1 Standard Management Registers

This section describes the IEEE 802.3 standard management registers corresponding to Clause 22.

**Table 32 Registers Overview- Standard Management Registers**

Register Short Name	Register Long Name	Reset Value
<b>STD_CTRL</b>	STD Control (Register 0.0)	3040 <sub>H</sub>
<b>STD_STAT</b>	Status Register (Register 0.1)	7949 <sub>H</sub>
<b>STD_PHYID1</b>	PHY Identifier 1 (Register 0.2)	C133 <sub>H</sub>
<b>STD_PHYID2</b>	PHY Identifier 2 (Register 0.3)	5400 <sub>H</sub> <sup>1)</sup>
<b>STD_AN_ADV</b>	Auto-Negotiation Advertisement (Register 0.4)	9DE1 <sub>H</sub>
<b>STD_AN_LPA</b>	Auto-Negotiation Link Partner Ability (Register 0.5)	1DE0 <sub>H</sub>
<b>STD_AN_EXP</b>	Auto-Negotiation Expansion (Register 0.6)	0064 <sub>H</sub>
<b>STD_AN_NPTX</b>	Auto-Negotiation Next Page Transmit Register (Register 0.7)	2001 <sub>H</sub>
<b>STD_AN_NPRX</b>	Auto-Negotiation Link Partner Received Next Page Register (Register 0.8)	0000 <sub>H</sub>
<b>STD_GCTRL</b>	Gigabit Control Register (Register 0.9)	0200 <sub>H</sub>
<b>STD_GSTAT</b>	Gigabit Status Register (Register 0.10)	0000 <sub>H</sub>
<b>STD_MMDCTRL</b>	MMD Access Control Register (Register 0.13)	0000 <sub>H</sub>
<b>STD_MMDDATA</b>	MMD Access Data Register (Register 0.14)	0000 <sub>H</sub>
<b>STD_XSTAT</b>	Extended Status Register (Register 0.15)	2000 <sub>H</sub>

1) For the device specific reset value, see the Product and Package Naming table in the [Product Ordering Information](#) chapter.

## 5.1.1 Standard Management Register Descriptions

This section describes all the STD registers in detail.

### STD Control (Register 0.0)

This register controls the main functions of the PHY.

IEEE Standard Register=0.0

#### STD\_CTRL

#### STD Control (Register 0.0)

Reset Value

3040<sub>H</sub>

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RST	LB	SSL	ANEN	PD	ISOL	ANRS	DPLX	COL	SSM						RES
RWSC	RW	RW	RW	RW	RW	RWSC	RW	RW	RW						RO

Field	Bits	Type	Description
RST	15	RWSC	<b>Reset</b> Resets the PHY to its default state. Active links are terminated. This is a self-clearing bit, which is set to zero by the hardware after a reset is performed. 0 <sub>B</sub> <b>NORMAL</b> Normal operational mode 1 <sub>B</sub> <b>RESET</b> Resets the device.
LB	14	RW	<b>Loopback on GMII</b> This mode enables looping back of MII data from the transmit to the receive direction. No data is transmitted to the Ethernet PHY. The device operates at the selected speed. The collision signal remains de-asserted unless otherwise forced by the collision test. 0 <sub>B</sub> <b>NORMAL</b> Normal operational mode 1 <sub>B</sub> <b>ENABLE</b> Closes the loopback from Tx to Rx at xMII.
SSL	13	RW	<b>Forced Speed Selection LSB</b> This bit only takes effect when bit ANEN is set to zero, which disables the auto-negotiation process. This is the lower bit (LSB) of the forced speed selection and is used in conjunction with the higher bit (MSB). The standard procedure to force 2500 Mbps operation (when ANEG is disabled) is to program PMA_CTRL with 1.0.6 = 1.0.13 = 1 and 1.0.5:2 = [0 1 1 0]. The GPHY mirrors 1.0.6, 1.0.13 and 0.0.6, 0.0.13. This is the MSB LSB bit value encoding: 00 <sub>B</sub> 10 Mbps 01 <sub>B</sub> 100 Mbps 10 <sub>B</sub> 1000 Mbps 11 <sub>B</sub> Reserved, defaults to 2500 Mbps operation when the PMA_CTRL register 1.0.5:2 equals [0 1 1 0].

Field	Bits	Type	Description (cont'd)
ANEN	12	RW	<b>Auto-Negotiation Enable</b> Allows enabling and disabling of the auto-negotiation process capability of the PHY. When enabled, the force bits for duplex mode (CTRL.DPLX) and the speed selection (CTRL.SSM, CTRL.SSL) become inactive; otherwise, the force bits define the PHY operation. 0 <sub>B</sub> <b>DISABLE</b> Disables the auto-negotiation protocol. 1 <sub>B</sub> <b>ENABLE</b> Enables the auto-negotiation protocol.
PD	11	RW	<b>Power Down</b> Forces the device into a power down state (SLEEP) in which power consumption is the bare minimum required to still maintain the MII management interface communication. When activating the power down functionality, the PHY terminates active data links. The MII interface is also stopped in power down mode. 0 <sub>B</sub> <b>NORMAL</b> Normal operational mode 1 <sub>B</sub> <b>POWERDOWN</b> Forces the device into power down mode.
ISOL	10	RW	<b>Isolate</b> The isolation mode isolates the PHY from the MAC. The MAC interface inputs are ignored, whereas the MAC interface outputs are set to tristate (high-impedance). 0 <sub>B</sub> <b>NORMAL</b> Normal operational mode 1 <sub>B</sub> <b>ISOLATE</b> Isolates the PHY from the MAC.
ANRS	9	RWSC	<b>Restart Auto-Negotiation</b> Restarts the auto-negotiation process on the MDI. This bit does not have any effect when auto-negotiation is disabled using CTRL.ANEN. This bit is self-clearing after the auto-negotiation process is initiated. 0 <sub>B</sub> <b>NORMAL</b> Stays in current mode. 1 <sub>B</sub> <b>RESTART</b> Restarts auto-negotiation.
DPLX	8	RW	<b>Forced Duplex Mode</b> This bit only takes effect when bit CTRL.ANEN is set to zero, which disables the auto-negotiation process. This bit controls the forced duplex mode. It allows forcing of the PHY into full-duplex or half-duplex mode. This bit does not take effect in loopback mode, when bit CTRL.LB is set to 1 <sub>B</sub> . It is only possible to force the duplex mode to half-duplex in 10BASE-T and 100BASE-TX speed modes. This field is ignored for higher speeds. 0 <sub>B</sub> <b>HD</b> Half-duplex 1 <sub>B</sub> <b>FD</b> Full-duplex
COL	7	RW	<b>Collision Test</b> Allows testing of the COL signal at the xMII interface. When the collision test is enabled, the state of the TX_EN signal is looped back to the COL signal within a minimum latency. 0 <sub>B</sub> <b>DISABLE</b> Normal operational mode 1 <sub>B</sub> <b>ENABLE</b> Activates the collision test.

Field	Bits	Type	Description (cont'd)
SSM	6	RW	<p><b>Forced Speed Selection MSB</b></p> <p>This bit only takes effect when bit ANEN is set to zero, which disables the auto-negotiation process. This is the higher bit (MSB) of the forced speed selection and is used in conjunction with the lower bit (LSB).</p> <p>The preferred way to force 2500 Mbps operation (when ANEG is disabled) is to program PMA_CTRL with 1.0.6 = 1.0.13 = 1 and 1.0.5:2 = [0 1 1 0].</p> <p>The GPHY mirrors 1.0.6, 1.0.13 and 0.0.6, 0.0.13.</p> <p>This is the MSB LSB bit value encoding:</p> <p>00<sub>B</sub> 10 Mbps  01<sub>B</sub> 100 Mbps  10<sub>B</sub> 1000 Mbps  11<sub>B</sub> Reserved, defaults to 2500 Mbps operation when the PMA_CTRL register 1.0.5:2 equals [0 1 1 0].</p>
RES	5:0	RO	<p><b>Reserved</b></p> <p>Write as zero, ignore on read.</p>

## Status Register (Register 0.1)

This register contains status and capability information about the device. All the bits are read-only. A write access by the MAC does not have any effect. Refer to IEEE 802.3 22.2.4.2.

IEEE Standard Register=0.1

## STD\_STAT

POLA	4	RW	<b>Polarity Inversion Control on Port A</b> 0 <sub>B</sub> <b>NORMAL</b> Polarity normal 1 <sub>B</sub> <b>INVERTED</b> Polarity inversion
MDICD	3	RW	<b>Mapping of MDI Ports C and D</b> Used when Auto-MDIX is OFF to force the MDIX cable crossover configuration. 0 <sub>B</sub> <b>MDI</b> Normal MDI mode 1 <sub>B</sub> <b>MDIX</b> Crossover MDI-X mode

Field	Bits	Type	Description (cont'd)
MDIAB	2	RW	<b>Mapping of MDI Ports A and B</b> Used when Auto-MDIX is OFF to force the MDIX cable crossover configuration. 0 <sub>B</sub> <b>MDI</b> Normal MDI mode 1 <sub>B</sub> <b>MDIX</b> Crossover MDI-X mode
RES	1	RO	<b>Reserved</b>
AMDIX	0	RW	<b>PHY Performs Auto-MDI/MDI-X or Uses Manual MDI/MDI-X</b> 0 <sub>B</sub> <b>MANUAL</b> PHY uses manual MDI/MDI-X. 1 <sub>B</sub> <b>AUTO</b> PHY performs Auto-MDI/MDI-X.

## IEEE Standard Register=0.20

### Reset Value

0006<sub>H</sub>

15					10	9	8	7		5	4	3	2	1	0
RES						SDET P	STICK Y	RES1		RES2		LP	PSCL	ANPD	LPI
						rw	rw	ro		rw		rw	rw	rw	rw

Field	Bits	Type	Description
SDETP	9	RW	<b>Signal Detection Polarity for the 1000BASE-X PHY</b> This field is reserved because 1000BASE-X is not supported on this PHY port.
STICKY	8	RW	<b>Sticky-Bit Handling</b> Setting this bit to 1 <sub>B</sub> ensures that all the vendor specific registers (of type RW) in the PHY (device 0), VSPEC1 (device 30), and VSPEC2 (device 31) are not changed during a MDIO reset or software reset of the GPHY. This allows the STA to keep the configurations chosen before reset. 0 <sub>B</sub> <b>OFF</b> Sticky-bit handling is disabled. 1 <sub>B</sub> <b>ON</b> Sticky-bit handling is enabled.
RES1	7:5	RO	<b>Reserved</b> Write as zero, ignored on read.
RES2	4	RW	<b>Reserved</b>
LP	3	RW	<b>Low Power Mode</b> Low Power Mode (LP) allows the GPHY to save energy by disabling most of the digital logic to reduce power consumption to its lowest level. The entry to LP is triggered when the PHY does not sense any energy on the cable and no link pulses (NLP, FLP, Beacons) are received. After spending VSPEC1_NBT_DS_CTRL.NRG_RST_CNT without energy in the ABILITY_DETECT state defined by IEEE 802.3 Clause 28, and after the timer defined VSPEC1_LOW_POWER_ENTRY_TIME.LPE_TIM expired, the PHY enters LP. 0 <sub>B</sub> <b>OFF</b> LP is disabled. The GPHY does not enter LP. 1 <sub>B</sub> <b>ON</b> LP is enabled. The GPHY enters LP when no energy is sensed.
PSCL	2	RW	<b>Power Consumption Scaling Depending on Link Quality</b> Allows enabling/disabling of the power consumption scaling depending on the link quality. 0 <sub>B</sub> <b>OFF</b> PSCL is disabled. 1 <sub>B</sub> <b>ON</b> PSCL is enabled.

Field	Bits	Type	Description (cont'd)
ANPD	1	RW	<b>Auto-Negotiation Power Down</b> Allows enabling/disabling of the power down modes during auto-negotiation looking for a link partner. 0 <sub>B</sub> <b>OFF</b> ANPD is disabled. 1 <sub>B</sub> <b>ON</b> ANPD is enabled.
LPI	0	RW	<b>Assert LPI via MDIO</b> Controls assertion/de-assertion of the LPI by the MDIO instead of following the (X)GMII LPI. Used to force the EEE on the TPI (ignoring the LPI indication from MAC). 0 <sub>B</sub> <b>DE-ASSERT</b> LPI is de-asserted on TPI. 1 <sub>B</sub> <b>ASSERT</b> LPI is asserted on TPI.

### Error Counter (Register 0.21)

This register controls the error counter. It allows the number of errors detected in the PHY to be counted for monitoring purposes.

IEEE Standard Register=0.21

#### PHY\_ERRCNT

Reset Value

#### Error Counter (Register 0.21)

0000<sub>H</sub>

15	12	11	8	7	0
RES			SEL		COUNT
ro			rw		rosc

Field	Bits	Type	Description
RES	15:12	RO	<b>Reserved</b> Write as zero, ignored on read.
SEL	11:8	RW	<b>Select Error Event</b> Configures which error type the error counter counts: 0000 <sub>B</sub> <b>RXERR</b> Receive errors are counted. 0001 <sub>B</sub> <b>RXACT</b> Receive frames are counted. 0010 <sub>B</sub> <b>ESDERR</b> ESD errors are counted. 0011 <sub>B</sub> <b>SSDERR</b> SSD errors are counted. 0100 <sub>B</sub> <b>TXERR</b> Transmit errors are counted. 0101 <sub>B</sub> <b>TXACT</b> Transmit frames events are counted. 0110 <sub>B</sub> <b>COL</b> Collision events are counted. 1000 <sub>B</sub> <b>NLD</b> Number of Link Down events are counted. 1001 <sub>B</sub> <b>NDS</b> Number of ADS events are counted. 1010 <sub>B</sub> <b>RES</b> Reserved 1011 <sub>B</sub> <b>RES</b> Reserved
COUNT	7:0	ROSC	<b>Counter Value</b> This counter value is updated each time the selected error event is detected. The counter value is reset every time a read operation on this register is performed or the error event is changed. The counter saturates at value FF <sub>H</sub> .

### Media-Independent Interface Status (Register 0.24)

This register contains status information on the Ethernet link, concatenated in a single register to allow concise status read by the STA in a single register.

IEEE Standard Register=0.24

MDIPC	4	RW	<b>MDI Polarity Change Detect Mask</b> When active, MDINT is activated upon detection of an MDI polarity change event. 0 <sub>B</sub> <b>INACTIVE</b> Interrupt is masked out. 1 <sub>B</sub> <b>ACTIVE</b> Interrupt is activated.
MDIXC	3	RW	<b>MDIX Change Detect Mask</b> When active, MDINT is activated upon detection of an MDI/MDIX cross-over change event. 0 <sub>B</sub> <b>INACTIVE</b> Interrupt is masked out. 1 <sub>B</sub> <b>ACTIVE</b> Interrupt is activated.
DXMC	2	RW	<b>Duplex Mode Change Mask</b> When active, MDINT is activated upon detection of full or half-duplex change. 0 <sub>B</sub> <b>INACTIVE</b> Interrupt is masked out. 1 <sub>B</sub> <b>ACTIVE</b> Interrupt is activated.
LSPC	1	RW	<b>Link Speed Change Mask</b> When active, MDINT is activated upon detection of link speed change. 0 <sub>B</sub> <b>INACTIVE</b> Interrupt is masked out. 1 <sub>B</sub> <b>ACTIVE</b> Interrupt is activated.
LSTC	0	RW	<b>Link State Change Mask</b> When active, MDINT is activated upon detection of link status change. 0 <sub>B</sub> <b>INACTIVE</b> Interrupt is masked out. 1 <sub>B</sub> <b>ACTIVE</b> Interrupt is activated.

**Interrupt Status Register (Register 0.26)**

This register defines the event source for the MDINT interrupt sent from the GPHY to an external chip.

PHY\_ISTAT is a cleared on read by the STA.

IEEE Standard Register=0.26

**PHY\_ISTAT**
**Reset Value**
**Interrupt Status Register (Register 0.26)**

rosc	rosc	rosc	rosc	rosc	rosc	rosc	rosc	rosc	rosc	rosc	rosc	rosc	rosc	rosc	rosc

Field	Bits	Type	Description
WOL	15	ROSC	<b>Wake-on-LAN Interrupt Status</b> When this bit is set, the MDINT is activated upon detection of a valid WoL event. 0 <sub>B</sub> <b>INACTIVE</b> This event is not the interrupt source. 1 <sub>B</sub> <b>ACTIVE</b> The WoL event is the source of the interrupt.
MSRE	14	ROSC	<b>Master/Slave Resolution Error Interrupt Status</b> When this bit is set, the MDINT is activated upon detection of a MSRE during a 1000BASE-T ANEG. 0 <sub>B</sub> <b>INACTIVE</b> This event is not the interrupt source. 1 <sub>B</sub> <b>ACTIVE</b> The MSRE event is the source of the interrupt.
NPRX	13	ROSC	<b>Next Page Received Interrupt Status</b> When this bit is set, the MDINT is activated upon reception of a next page in STD_AN_NPRX. 0 <sub>B</sub> <b>INACTIVE</b> This event is not the interrupt source. 1 <sub>B</sub> <b>ACTIVE</b> The NPRX event is the source of the interrupt.
NPTX	12	ROSC	<b>Next Page Transmitted Interrupt Status</b> When this bit is set, the MDINT is activated upon transmission of the currently stored next page in STD_AN_NPTX. 0 <sub>B</sub> <b>INACTIVE</b> This event is not the interrupt source. 1 <sub>B</sub> <b>ACTIVE</b> The NPTX event is the source of the interrupt.
ANE	11	ROSC	<b>Auto-Negotiation Error Interrupt Status</b> When this bit is set, the MDINT is activated upon detection of an ANEG error. 0 <sub>B</sub> <b>INACTIVE</b> This event is not the interrupt source. 1 <sub>B</sub> <b>ACTIVE</b> The ANEG error event is the source of the interrupt.
ANC	10	ROSC	<b>Auto-Negotiation Complete Interrupt Status</b> When this bit is set, the MDINT is activated upon completion of the ANEG process. 0 <sub>B</sub> <b>INACTIVE</b> This event is not the interrupt source. 1 <sub>B</sub> <b>ACTIVE</b> The ANEG complete event is the source of the interrupt.

Field	Bits	Type	Description (cont'd)
LOR	8	ROSC	<b>SyncE Loss Of Reference</b> When this bit is set, MDINT is activated upon loss of SyncE reference clock. 0 <sub>B</sub> <b>INACTIVE</b> This event is not the interrupt source. 1 <sub>B</sub> <b>ACTIVE</b> The LOR change event is the source of the interrupt.
LP	7	ROSC	<b>LP Entry Indication</b> 0 <sub>B</sub> <b>INACTIVE</b> No indication of LP entry 1 <sub>B</sub> <b>ACTIVE</b> Indication of LP entry.
TEMP	6	ROSC	<b>TEMP</b> Indicates that thermal mitigation action must be taken when the temperature goes beyond the normal operating range. The GPHY implements ADS by default when this happens, but it is possible to disable ADS. When the SoC disables ADS, it is recommended that the SoC initiates a link down and changes the speed capability to cool the device back to the normal temperature range. When the temperature reaches the maximum absolute rating, the device resets for safety purposes. Thermal mitigation must ensure that the maximum absolute temperature limits are never reached. 0 <sub>B</sub> <b>INACTIVE</b> This event is not the interrupt source. 1 <sub>B</sub> <b>ACTIVE</b> The TEMP change event is the source of the interrupt.
ADSC	5	ROSC	<b>Link Speed Auto-Downspeed Detect Interrupt Status</b> When this bit is set, the MDINT is activated upon detection of a link speed ADS event. 0 <sub>B</sub> <b>INACTIVE</b> This event is not the interrupt source. 1 <sub>B</sub> <b>ACTIVE</b> The ADSC change event is the source of the interrupt.
MDIPC	4	ROSC	<b>MDI Polarity Change Detect Interrupt Status</b> When this bit is set, the MDINT is activated upon detection of an MDI polarity change event. 0 <sub>B</sub> <b>INACTIVE</b> This event is not the interrupt source. 1 <sub>B</sub> <b>ACTIVE</b> The MDIPC change event is the source of the interrupt.
MDIXC	3	ROSC	<b>MDIX Change Detect Interrupt Status</b> When this bit is set, the MDINT is activated upon detection of an MDI/MDIX cross-over change event. 0 <sub>B</sub> <b>INACTIVE</b> This event is not the interrupt source. 1 <sub>B</sub> <b>ACTIVE</b> The MDIX change event is the source of the interrupt.
DXMC	2	ROSC	<b>Duplex Mode Change Interrupt Status</b> When this bit is set, the MDINT is activated upon detection of a full or half-duplex change. 0 <sub>B</sub> <b>INACTIVE</b> This event is not the interrupt source. 1 <sub>B</sub> <b>ACTIVE</b> The DXMC change event is the source of the interrupt.
LSPC	1	ROSC	<b>Link Speed Change Interrupt Status</b> When this bit is set, the MDINT is activated upon detection of link speed change. 0 <sub>B</sub> <b>INACTIVE</b> This event is not the interrupt source. 1 <sub>B</sub> <b>ACTIVE</b> The LSPC change event is the source of the interrupt.

Field	Bits	Type	Description (cont'd)
LSTC	0	ROSC	<b>Link State Change Interrupt Status</b> When this bit is set, the MDINT is activated upon detection of link status change. 0 <sub>B</sub> <b>INACTIVE</b> This event is not the interrupt source. 1 <sub>B</sub> <b>ACTIVE</b> The LSTC change event is the source of the interrupt.

### LED Control Register (Register 0.27)

This register contains the control bits for direct access to the LEDs by setting the on/off LEDxDA bits (where x is from 0 to 2).

To directly control the LED, the integrated LED functions must be disabled by the LEDxEN bit in this register.

The integrated LED functions are specified in the more sophisticated LED control registers in the MMD device VSPEC1.

IEEE Standard Register=0.27

### PHY\_LED

rw	rw	ro	rw			rw	ro		rw		ro		rw	rw

Field	Bits	Type	Description
RES	15:14	RW	<b>Reserved</b> Write as zero, ignore on read.
MODE	13	RW	<b>TPG Mode</b> Configures the packet generation mode. 0 <sub>B</sub> <b>CONTINUOUS</b> Sends packets continuously. 1 <sub>B</sub> <b>SINGLE</b> Sends a single packet.
RES3	12	RO	<b>Reserved</b> Write as zero, ignore on read.
IPGL	11:10	RW	<b>Inter-Packet Gap Length</b> Configures the length of the inter-packet gap in bit times. 00 <sub>B</sub> <b>RES</b> Reserved 01 <sub>B</sub> <b>BT96</b> Length is 96 bit times 10 <sub>B</sub> <b>BT960</b> Length is 960 bit times 11 <sub>B</sub> <b>BT9600</b> Length is 9600 bit times
TYPE	9:8	RW	<b>Packet Data Type</b> Configures the packet data type to be either predefined, byte increment, or random. When predefined, the content of the register TPGDATA is used. 00 <sub>B</sub> <b>RANDOM</b> Uses random data as the packet content. 01 <sub>B</sub> <b>BYTEINC</b> Uses byte increment as the packet content. 10 <sub>B</sub> <b>PREDEF</b> Uses predefined content of the register TPGDATA. 11 <sub>B</sub> <b>RES</b> Reserved.
RES2	7	RO	<b>Reserved.</b> Write as zero, ignore on read.

Field	Bits	Type	Description (cont'd)
SIZE	6:4	RW	<b>Packet Size</b> Configures the size of the generated Ethernet packets in bytes. The size includes DA, SA, length/type, payload, and FCS. 000 <sub>B</sub> <b>B64</b> Packet length is 64 bytes 001 <sub>B</sub> <b>B2048</b> Packet length is 2048 bytes 010 <sub>B</sub> <b>B256</b> Packet length is 256 bytes 011 <sub>B</sub> <b>B4096</b> Packet length is 4096 bytes 100 <sub>B</sub> <b>B1024</b> Packet length is 1024 bytes 101 <sub>B</sub> <b>B1518</b> Packet length is 1518 bytes 110 <sub>B</sub> <b>B9000</b> Packet length is 9000 bytes
RES1	3:2	RO	<b>Reserved</b> Write as zero, ignore on read.
START	1	RW	<b>Start or Stop TPG Data Generation.</b> Starts the TPG data generation. Depending on the MODE, the TPG sends only one packet or chunks of 10000 packets until stopped. 0 <sub>B</sub> <b>STOP</b> Stops the TPG data generation. 1 <sub>B</sub> <b>START</b> Starts the TPG data generation.
EN	0	RW	<b>Enable the TPG</b> Enables the TPG for data generation. 0 <sub>B</sub> <b>DISABLE</b> Disables the TPG 1 <sub>B</sub> <b>ENABLE</b> Enables the TPG

### Test-Packet Generator Data (Register 0.29)

Specifies the payload data to be used when sending a non-random data packet. All payload data bytes are sent with this value.

IEEE Standard Register=0.29

### PHY\_TPGDATA

Reset Value

### Test-Packet Generator Data (Register 0.29)

00AA<sub>H</sub>

Field	Bits	Type	Description
DA	15:12	RW	<b>Destination Address</b> Configures the destination address nibble. The destination address builds up to 00-03-19-FF-FF-F[DA].
SA	11:8	RW	<b>Source Address</b> Configures the source address nibble. The source address builds up to 00-03-19-FF-FF-F[SA].
DATA	7:0	RW	<b>Data Byte to be Transmitted</b> This is the content of the payload bytes in the frame to send constant data. The bit masks are shown here. For configuration details, refer to the corresponding chapter. 80 <sub>H</sub> <b>PREC</b> Selects whether to take full precision (1) or reduced precision (0) at bit 7 60 <sub>H</sub> <b>PREC2</b> For reduced precision, selects the options with bits [6:5] 10 <sub>H</sub> <b>RESERVED</b> Reserved

### Firmware Version Register (Register 0.30)

This register contains the version of the PHY firmware. The firmware initializes the version number at boot time with its current software version. This register is read-only by the external STA.

IEEE Standard Register=0.30

#### PHY\_FWV

Reset Value

### Firmware Version Register (Register 0.30)

0000<sub>H</sub>

Field	Bits	Type	Description
REL	15	RO	<b>Release Indication</b> This parameter indicates either a test or a release version. 0 <sub>B</sub> <b>TEST</b> Indicates a test version. 1 <sub>B</sub> <b>RELEASE</b> Indicates a released version.
MAJOR	14:8	RO	<b>Major Version Number</b> Specifies the main version release number of the firmware.
MINOR	7:0	RO	<b>Minor Version Number</b> Specifies the sub-version release number of the firmware.

### Internal Test Modes CDIAG and ABIST (Register 0.31)

This is the control register used to configure the Gigabit Ethernet behavior of the PHY. Refer to IEEE 802.3 40.5.1.1.

IEEE Standard Register=0.31

### PHY\_TEST

## 6.1.1 PMAPMD Register Descriptions

This section describes all the PMAPMD registers in detail.

### PMA/PMD Control 1 (Register 1.0)

IEEE Standard Register=1.0

#### PMA\_CTRL1

#### PMA/PMD Control 1 (Register 1.0)

Reset Value

2058<sub>H</sub>

15	14	13	12	11	10	7	6	5	2	1	0
RST	RES	SSL	RES	LOW_POWER*	RES	SSM	SPEED_SEL	NS1	NS2		
RW		RW		RW		RW	RW		RO	RO	

Field	Bits	Type	Description
RST	15	RW	<b>Reset</b> 0 <sub>B</sub> Normal operation 1 <sub>B</sub> PMA/PMD reset
SSL	13	RW	<b>Speed Selection (LSB)</b> Used in conjunction with field SPEED_SEL_MSB. MSB LSB: 00 <sub>B</sub> 10 Mbps 01 <sub>B</sub> 100 Mbps 10 <sub>B</sub> 1000 Mbps 11 <sub>B</sub> Bits [5:2] select the speed (SPEED_SEL field)
LOW_POWER	11	RW	<b>Low Power</b> 0 <sub>B</sub> Normal operation 1 <sub>B</sub> Enters low power mode.
SSM	6	RW	<b>Speed Selection (MSB)</b> Used in conjunction with field SPEED_SEL_LSB. MSB LSB: 00 <sub>B</sub> 10 Mbps 01 <sub>B</sub> 100 Mbps 10 <sub>B</sub> 1000 Mbps 11 <sub>B</sub> Bits [5:2] select the speed (SPEED_SEL field)
SPEED_SEL	5:2	RW	<b>Speed Selection</b> Bit usage (from bit 5 to bit 2): 0 0 0 0 <sub>B</sub> Not supported. The speed defaults to 2.5 Gbps. 0 0 0 1 <sub>B</sub> Not supported. The speed defaults to 2.5 Gbps. 0 0 1 0 <sub>B</sub> Not supported. The speed defaults to 2.5 Gbps. 0 0 1 1 <sub>B</sub> Not supported. The speed defaults to 2.5 Gbps. 0 1 0 0 <sub>B</sub> Not supported. The speed defaults to 2.5 Gbps. 0 1 0 1 <sub>B</sub> Not supported. The speed defaults to 2.5 Gbps. 0 1 1 0 <sub>B</sub> 2.5 Gbps 0 1 1 1 <sub>B</sub> Not supported 1 x x x <sub>B</sub> Reserved

Field	Bits	Type	Description (cont'd)
NS1	1	RO	<b>Not Supported</b> PMA remote loopback mode is not supported by the GPHY.
NS2	0	RO	<b>Not Supported</b> PMA local loopback mode is not supported by the GPHY.

### PMA/PMD Status 1 (Register 1.1)

IEEE Standard Register=1.1

#### PMA\_STAT1

#### PMA/PMD Status 1 (Register 1.1)

Reset Value

0000<sub>H</sub>

Field	Bits	Type	Description
FAULT	7	RO	<b>Fault</b> 0 <sub>B</sub> Fault condition not detected 1 <sub>B</sub> Fault condition detected
RX_LINK_STATUS	2	RO	<b>Receive Link Status</b> 0 <sub>B</sub> PMA/PMD receive link down 1 <sub>B</sub> PMA/PMD receive link up
LOW_POWER_ABILITY	1	RO	<b>Low Power Ability</b> 0 <sub>B</sub> PMA/PMD does not support low power mode. 1 <sub>B</sub> PMA/PMD supports low power mode.

**PHY Identifier 1 (Register 1.2)**

IEEE Standard Register=1.2

Bits 31 - 16 of device ID

<b>PMA_DEVID1</b>	<b>Reset Value</b>
<b>PHY Identifier 1 (Register 1.2)</b>	<b>C133<sub>H</sub></b>

Field	Bits	Type	Description
OUI	15:0	RO	<b>Organizationally Unique Identifier</b> Organizationally Unique Identifier Bits 3:18

### PHY Identifier 2 (Register 1.3)

IEEE Standard Register=1.3

Bits 15 - 0 of device ID

#### PMA\_DEVID2

### PHY Identifier 2 (Register 1.3)

Reset Value

5400<sub>H</sub>

Field	Bits	Type	Description
OUI	15:10	RO	<b>Organizationally Unique Identifier Bits 19:24</b>
LDN	9:4	RO	<b>Device Number</b> Specifies the device number <sup>1)</sup> to distinguish between several different products.
LDRN	3:0	RO	<b>Device Revision Number</b> Specifies the device revision number <sup>1)</sup> to distinguish between several versions of this device.

1) For the device specific reset value, see the Product and Package Naming table in the [Product Ordering Information](#) chapter.

**PMA/PMD Speed Ability (Register 1.4)**

IEEE Standard Register=1.4

**PMA\_SPEED\_ABILITY**
**Reset Value**
**PMA/PMD Speed Ability (Register 1.4)**
**2070<sub>H</sub>**

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## IEEE Standard Register=1.129

Indicates startup for 2.5G was completed.

When read as a 1, indicates that the startup protocol (for 2.5G/5GBASE-T) was completed (link\_status = OK, pcs\_status = OK), and that the contents of bits 1.130.11:0 (Polarity), 1.131.15:10 (PBO), 1.145.14:8 (Skew), 1.146.14:8, and 1.146.6:0 (Skew), established during the startup protocol, are valid.

When read as a 0, indicates that the startup process was not completed, and that the contents of bit 1.129.0, established during the startup protocol, are invalid. A PMA must return a value of 0 in bit 1.129.1 when the PMA link\_status = FAIL.

### Reset Value

0000<sub>H</sub>[illegible]

IEEE Standard Register=1.138

<b>PMA_MGBT_MINMARGIN_B</b>	<b>Reset Value</b>
<b>MULTIGBASE-T SNR Minimum Margin Channel B (Register 1.138)</b>	<b>0000<sub>H</sub></b>

Field	Bits	Type	Description
MINMARGIN_B	15:0	RO	<b>MINMARGIN_B</b> Lowest value observed in the SNR operating margin channel B register (1.134) since the last read

### MULTIGBASE-T SNR Minimum Margin Chan C (Register 1.139)

The minimum margin channel C register contains a latched copy of the lowest value observed in the SNR operating margin channel C register (1.135) since the last read.

IEEE Standard Register=1.139

**PMA\_MGBT\_MINMARGIN\_C**

**Reset Value**

**MULTIGBASE-T SNR Minimum Margin Chan C (Register 1.139)**

**0000<sub>H</sub>**

Field	Bits	Type	Description
MINMARGIN_C	15:0	RO	<b>MINMARGIN_C</b> Lowest value observed in the SNR operating margin channel C register (1.135) since the last read

### MULTIGBASE-T SNR Minimum Margin Chan D (Register 1.140)

The Minimum margin channel D register contains a latched copy of the lowest value observed in the SNR operating margin channel D register (1.136) since the last read.

IEEE Standard Register=1.140

**PMA\_MGBT\_MINMARGIN\_D**

**Reset Value**

**MULTIGBASE-T SNR Minimum Margin Chan D (Register 1.140)**

**0000<sub>H</sub>**

Field	Bits	Type	Description
MINMARGIN_D	15:0	RO	<b>MINMARGIN_D</b> Lowest value observed in the SNR operating margin channel D register (1.136) since the last read

**MULTIGBASE-T Rx Power Channel A (Register 1.141)**

The Rx signal power channel A register is read only and contains the receive signal power measured at the MDI during training as described in 55.4.3.1.

IEEE Standard Register=1.141

Field	Bits	Type	Description
POWER_A	15:0	RO	<b>POWER_A</b> Receive signal power measured at the MDI during training

### MULTIGBASE-T Rx Power Channel B (Register 1.142)

The Rx signal power channel B register is read only and contains the receive signal power measured at the MDI during training as described in 55.4.3.1.

IEEE Standard Register=1.142

**PMA\_MGBT\_POWER\_B**

**Reset Value**

**MULTIGBASE-T Rx Power Channel B (Register 1.142)**

**0000<sub>H</sub>**

Field	Bits	Type	Description
POWER_B	15:0	RO	<b>POWER_B</b> Receive signal power measured at the MDI during training

### MULTIGBASE-T Rx Power Chan C (Register 1.143)

The Rx signal power channel C register is read only and contains the receive signal power measured at the MDI during training as described in 55.4.3.1.

IEEE Standard Register=1.143

PMA\_MGBT\_POWER\_C

Reset Value

MULTIGBASE-T Rx Power Chan C (Register 1.143)

0000<sub>H</sub>

Field	Bits	Type	Description
POWER_C	15:0	RO	<b>POWER_C</b> Receive signal power measured at the MDI during training

### MULTIGBASE-T Rx Power Chan D (Register 1.144)

The Rx signal power channel D register is read only and contains the receive signal power measured at the MDI during training as described in 55.4.3.1.

IEEE Standard Register=1.144

**PMA\_MGBT\_POWER\_D**

**Reset Value**

**MULTIGBASE-T Rx Power Chan D (Register 1.144)**

**0000<sub>H</sub>**

Field	Bits	Type	Description
POWER_D	15:0	RO	<b>POWER_D</b> Receive signal power measured at the MDI during training

### MULTIGBASE-T Skew Delay 0 (Register 1.145)

IEEE Standard Register=1.145

The skew delay reports the current skew delay on each of the pairs with respect to physical pair A. It is reported with 1.25 ns resolution to an accuracy of 2.5 ns. The number is in two's complement notation with positive values representing delay and negative values representing advance with respect to physical pair A. When the delay exceeds the maximum amount represented by the range -80 ns to +78.75 ns, the field displays the maximum value.

#### PMA\_MGBT\_SKEW\_DELAY\_0

Reset Value

### MULTIGBASE-T Skew Delay 0 (Register 1.145)

0000<sub>H</sub>

Field	Bits	Type	Description
SKEW_DELAY_B	14:8	RO	<b>Skew Delay B</b> Skew delay for pair B

### MULTIGBASE-T Skew Delay 1 (Register 1.146)

IEEE Standard Register=1.146

The skew delay reports the current skew delay on each of the pairs with respect to physical pair A. It is reported with 1.25 ns resolution to an accuracy of 2.5 ns. The number is in two's complement notation with positive values representing delay and negative values representing advance with respect to physical pair A. When the delay exceeds the maximum amount represented by the range -80 ns to +78.75 ns, the field displays the maximum value.

#### PMA\_MGBT\_SKEW\_DELAY\_1

Reset Value

### MULTIGBASE-T Skew Delay 1 (Register 1.146)

0000<sub>H</sub>

Field	Bits	Type	Description
SKEW_DELAY_D	14:8	RO	<b>Skew Delay D</b> Skew delay for pair D
SKEW_DELAY_C	6:0	RO	<b>Skew Delay C</b> Skew delay for pair C

## MULTIGBASE-T Skew Delay 2 (Register 1.147)

IEEE Standard Register=1.147

### PMA\_MGBT\_FAST\_RETRAIN\_STA\_CTRL

## MULTIGBASE-T Skew Delay 2 (Register 1.147)

Reset Value

0010<sub>H</sub>

15	11	10	6	5	4	3	2	1	0
LP_FAST_RETRAIN_COUNT				RES	FAST_RE*	FAST_RE*	FAST_RETRAIN_SIG*	FAST_RE*	
ro					ro	ro	rw	rw	

Field	Bits	Type	Description
LP_FAST_RETRAIN_COUNT	15:11	RO	<b>LP Fast Retrain Count</b> Counts the number of fast retrains requested by the link partner.
LD_FAST_RETRAIN_COUNT	10:6	RO	<b>LD Fast Retrain Count</b> Counts the number of fast retrains requested by the local device.
FAST_RETRAIN_ABILITY	4	RO	<b>Fast Retrain Ability</b> 0 <sub>B</sub> Fast retrain capability is not supported. 1 <sub>B</sub> Fast retrain capability is supported.
FAST_RETRAIN_NEGOTIATED	3	RO	<b>Fast Retrain Negotiated</b> 0 <sub>B</sub> Fast retrain capability was not negotiated. 1 <sub>B</sub> Fast retrain capability was negotiated.
FAST_RETRAIN_SIG_TYPE	2:1	RW	<b>Fast Retrain Signal Type</b> 00 <sub>B</sub> PHY signals IDLE during fast retrain 01 <sub>B</sub> PHY signals local fault during fast retrain 10 <sub>B</sub> PHY signals link interruption during fast retrain 11 <sub>B</sub> Reserved
FAST_RETRAIN_ENABLE	0	RW	<b>Fast Retrain Enable</b> 0 <sub>B</sub> Fast retrain capability is disabled. 1 <sub>B</sub> Fast retrain capability is enabled.

## IEEE Standard Register=1.1800

0000<sub>H</sub>[illegible]

Field	Bits	Type	Description
TXDEL	1	RO	<b>Transmit Data Path Delay Information</b> Not supported by the GPHY. 0 <sub>B</sub> <b>NONE</b> PHYs do not have this capability. 1 <sub>B</sub> <b>CAPABLE</b> Minimum and maximum Tx data path delay available
RXDEL	0	RO	<b>Receive Data Path Delay Information</b> Not supported by the GPHY. 0 <sub>B</sub> <b>NONE</b> PHYs do not have this capability. 1 <sub>B</sub> <b>CAPABLE</b> Minimum and maximum Rx data path delay available

## 6.2 Standard PCS Registers

This section describes the PCS registers for MMD device 0x03.

**Table 36 Registers Overview- Standard PCS Registers**

Register Short Name	Register Long Name	Reset Value
<a href="#">PCS_CTRL1</a>	PCS Control 1 (Register 3.0)	205C <sub>H</sub>
<a href="#">PCS_STAT1</a>	PCS Status 1 (Register 3.1)	0000 <sub>H</sub>
<a href="#">PCS_DEVID1</a>	PHY Identifier 1 (Register 3.2)	C133 <sub>H</sub>
<a href="#">PCS_DEVID2</a>	PHY Identifier 2 (Register 3.3)	5400 <sub>H</sub> <sup>1)</sup>
<a href="#">PCS_SPEED_ABILITY</a>	PCS Speed Ability (Register 3.4)	0040 <sub>H</sub>
<a href="#">PCS_DIP1</a>	PCS Devices in Package 1 (Register 3.5)	008B <sub>H</sub>
<a href="#">PCS_DIP2</a>	PCS Devices in Package 2 (Register 3.6)	C000 <sub>H</sub>
<a href="#">PCS_CTRL2</a>	PCS Control 2 (Register 3.7)	000A <sub>H</sub>
<a href="#">PCS_STAT2</a>	PCS Status 2 (Register 3.8)	9000 <sub>H</sub>
<a href="#">PCS_PACKID1</a>	PCS Package Identifier 1 (Register 3.14)	C133 <sub>H</sub>
<a href="#">PCS_PACKID2</a>	PCS Package Identifier 2 (Register 3.15)	5400 <sub>H</sub> <sup>1)</sup>
<a href="#">PCS_EEE_CAP</a>	PCS EEE Capability (Register 3.20)	0006 <sub>H</sub>
<a href="#">PCS_EEE_CAP2</a>	EEE Control and Capability 2 (Register 3.21)	0001 <sub>H</sub>
<a href="#">PCS_EEE_WAKERR</a>	PCS EEE Status Register 1 (Register 3.22)	0000 <sub>H</sub>
<a href="#">PCS_2G5_STAT1</a>	BASE-R and 10GBASE-T PCS Status 1 (Register 3.32)	0000 <sub>H</sub>
<a href="#">PCS_2G5_STAT2</a>	MULTIGBASE-T PCS Status 2 (Register 3.33)	0000 <sub>H</sub>
<a href="#">PCS_TIMESYNC_CAP</a>	PCS TimeSync Capability Register (Register 3.1800)	0000 <sub>H</sub>

1) For the device specific reset value, see the Product and Package Naming table in the [Product Ordering Information](#) chapter.

## 6.2.1 PCS Register Descriptions

This section describes all the PCS registers in detail.

### PCS Control 1 (Register 3.0)

IEEE Standard Register=3.0

#### PCS\_CTRL1

#### PCS Control 1 (Register 3.0)

Reset Value

205C<sub>H</sub>

15	14	13	12	11	10	9	7	6	5	2	1	0
RST	LOOP BACK	SSL	RES	LOW_ POW*	RXCK ST	RES		SSM	SPEED_SEL		RES	
rW	rW	rW		rW	rW			rW	rW			

Field	Bits	Type	Description
RST	15	RW	<b>Reset</b> 0 <sub>B</sub> Normal operation 1 <sub>B</sub> PCS reset - Self-clearing
LOOPBACK	14	RW	<b>Loopback</b> 0 <sub>B</sub> Disable loopback mode 1 <sub>B</sub> Enable loopback mode
SSL	13	RW	<b>Forced Speed Selection (LSB)</b> This bit is used in conjunction with SPEED_SEL_LSB. The bit assignment order is: MSB LSB 00 <sub>B</sub> 10 Mbps 01 <sub>B</sub> 100 Mbps 10 <sub>B</sub> 1000 Mbps 11 <sub>B</sub> Bits [5:2] select the speed
LOW_POWER	11	RW	<b>Low Power</b> 0 <sub>B</sub> Normal operation 1 <sub>B</sub> Low-power mode
RXCKST	10	RW	<b>Clock Stop Enable</b> The MAC sets this bit to active to allow the GPHY to stop the clocking during the LPI_MODE. 0 <sub>B</sub> The clock is not stoppable. 1 <sub>B</sub> The GPHY stops the (X)GMII clock during LPI.
SSM	6	RW	<b>Forced Speed Selection (MSB)</b> This bit is used in conjunction with SPEED_SEL_MSB. The bit assignment order is: MSB LSB 00 <sub>B</sub> 10 Mbps 01 <sub>B</sub> 100 Mbps 10 <sub>B</sub> 1000 Mbps 11 <sub>B</sub> Bits [5:2] select the speed

Field	Bits	Type	Description (cont'd)
SPEED_SEL	5:2	RW	<b>Forced Speed Selection Values</b> 0 0 0 0 <sub>B</sub> Unsupported, defaults to 2.5 Gbps 0 0 0 1 <sub>B</sub> Unsupported, defaults to 2.5 Gbps 0 0 1 0 <sub>B</sub> Unsupported, defaults to 2.5 Gbps 0 0 1 1 <sub>B</sub> Unsupported, defaults to 2.5 Gbps 0 1 0 0 <sub>B</sub> Unsupported, defaults to 2.5 Gbps 0 1 0 1 <sub>B</sub> Reserved 0 1 1 1 <sub>B</sub> 2.5 Gbps 1 1 x x <sub>B</sub> Reserved

### PCS Status 1 (Register 3.1)

IEEE Standard Register=3.1

#### PCS\_STAT1

#### PCS Status 1 (Register 3.1)

Reset Value

0000<sub>H</sub>

Field	Bits	Type	Description
RES3	15:10	RO	<b>Reserved</b> Value always zero, writes ignored.
PDF	9	RO	<b>Parallel Detection Fault</b> 0 <sub>B</sub> <b>NOFAULT</b> No fault detected 1 <sub>B</sub> <b>FAULT</b> Fault detected via the parallel mechanism
RES2	8	RO	<b>Reserved</b> Value always 0, writes ignored.
XNPS	7	RO	<b>Extended Next Page Status</b> When set to 1 <sub>B</sub> , bit 7.1.7 indicates that both the GPHY and the link partner confirmed support for extended next page. When set to 0 <sub>B</sub> , bit 7.1.7 indicates that the extended next page feature is not used. 0 <sub>B</sub> <b>ZERO</b> Extended next page is not allowed. 1 <sub>B</sub> <b>ONE</b> Extended next page format is used.
PR	6	RO	<b>Page Received</b> The Page Received bit (7.1.6) is set to 1 <sub>B</sub> to indicate that a new link codeword was received and stored in the AN LP Base Page ability registers 7.19 or AN LP XNP ability registers 7.25 to 7.27. 0 <sub>B</sub> <b>ZERO</b> No page received 1 <sub>B</sub> <b>ONE</b> Page received
ANEG_COMPLETE	5	RO	<b>Auto-Negotiation Complete</b> When read as a 1, bit 7.1.5 indicates that the ANEG process was completed and that the contents of the ANEG registers 7.16 and 7.19 are valid. When read as a 0, bit 7.1.5 indicates that the ANEG process was not completed and that the contents of the 7.19, 7.22 through 7.27, and 7.33 registers are as defined by the current state of the ANEG protocol, or as written by manual configuration. 0 <sub>B</sub> <b>ZERO</b> ANEG process not completed 1 <sub>B</sub> <b>ONE</b> ANEG process completed

Field	Bits	Type	Description (cont'd)
ANEG_RF	4	ROSC	<b>Remote Fault</b> When read as 1, bit 7.1.4 indicates that a remote fault condition was detected. Bit 7.1.4 is a copy of bit 1.4 in register 1, device 0. 0 <sub>B</sub> <b>NORMAL</b> No remote fault condition detected 1 <sub>B</sub> <b>FAULT</b> Remote fault condition detected
ANEG_ABLE	3	RO	<b>Auto-Negotiation Ability</b> Bit 7.1.3 is a copy of bit 1.3 in register 1. This is the ANEG ability of the GPHY. 0 <sub>B</sub> <b>UNABLE</b> PHY is not able to perform ANEG. 1 <sub>B</sub> <b>ABLE</b> PHY is able to perform ANEG.
LINKSTA	2	RO	<b>Link Status</b> When read as 1 <sub>B</sub> , bit 7.1.2 indicates that the PMA/PMD determined that a valid link is established. This bit is a duplicate of the PMA/PMD link status bit in 1.1.2. This bit latches low so it does not represent the current status, but is used to indicate link drop since the last read from the management interface. Reading this bit from the MDIO resets the bit to the current value of the link. 0 <sub>B</sub> <b>DOWN</b> Link is down. 1 <sub>B</sub> <b>UP</b> Link is up.
RES1	1	RO	<b>Reserved</b> Value always 0, write ignored.
LP_ANEG_ABLE	0	RO	<b>Link Partner Auto-Negotiation Ability</b> 0 <sub>B</sub> <b>UNABLE</b> Link partner is not capable of ANEG. 1 <sub>B</sub> <b>ABLE</b> Link partner is capable of ANEG.

## 6.4.1 VSPEC1 Register Descriptions

This section describes all the VSPEC1 registers in detail.

### Configuration for LED Pin 0 (Register 30.1)

This register configures the behavior of the LED0 pin depending on predefined states or events the PHY entered into or raised. Since more than one event/state may be active at the same time, more than one function may apply at the same time. The priority from highest to lowest is given by the order: PULSE, BLINKS, BLINKF, and CON. The LED PULSE for the selected activity is only displayed for the link speed selected in CON. When CON is selected as NONE, no PULSE is displayed on the LED for any activity. To avoid the LED being constantly on when it is configured for pulsing alone, set the NO\_CON bit in the PULSE field (bit 11).

IEEE Standard Register=30.1

SYNCE_CLK	6:5	RW	<b>Configure the SyncE Clock Frequency Class</b> MaxLinear recommends using the API to configure SyncE. 00 <sub>B</sub> <b>PSTN</b> The SyncE clock frequency is PSTN class: 8 kHz. 01 <sub>B</sub> <b>EEC1</b> The SyncE clock frequency is EEC-1 class: 2.048 MHz. 10 <sub>B</sub> <b>EEC2</b> The SyncE clock frequency is EEC-2 class: 1.544 MHz. 11 <sub>B</sub> <b>RES</b> Reserved
SYNCE_EN	4	RW	<b>Enable SyncE Feature</b> SyncE is disabled by default. MaxLinear recommends using the API to enable SyncE. 0 <sub>B</sub> <b>DISABLE</b> Disable SyncE 1 <sub>B</sub> <b>ENABLE</b> Enable SyncE

Field	Bits	Type	Description
SI	1	RW	<p><b>Super Isolate</b></p> <p>Use in Super Isolate mode. Forces the device into a power down state by pin strapping (SLEEP) in which power consumption is the bare minimum required to still maintain the MII management interface communication. When activating the power down functionality, the PHY terminates active data links. The MII interface is also stopped in power down mode. See also IEEE 802.3-2008 22.2.4.1.5. The SI bit is only used to release the device from Super Isolate mode. Entering Super Isolate mode can only be activated by pin strapping at power up.</p> <p>0<sub>B</sub>    <b>NORMAL</b> Normal operational mode</p> <p>1<sub>B</sub>    <b>SUPER_ISOLATE</b> Super Isolate mode</p>

### Temperature Code (Register 30.14)

Junction temperature is presented in degrees Celsius

IEEE Standard Register=30.14

VSPEC1\_TEMP\_STA

Reset Value

Temperature Code (Register 30.14)

0000<sub>H</sub>

Field	Bits	Type	Description
TEMP_DATA	15:0	RO	<b>Junction Temperature</b> The temperature is represented as a two's complement binary fixed point number, of which the 7 LSBs are fractional. The STA must take the thermal mitigation measures when the junction temperature exceeds the normal operating range if ADS is disabled. TEMP_DATA is invalid when the value is 0000 <sub>H</sub> . Example Tj Values (Decimal): <ul style="list-style-type: none"> <li>For Tj = -40 degC, TEMP_DATA = EC00<sub>H</sub></li> <li>For Tj = +125 degC, TEMP_DATA = 3E80<sub>H</sub></li> </ul>

This register defines the mask for the Interrupt Status Register (ISTAT), which contains the event source for the MDINT interrupt sent from the GPHY to an external chip. The mask is cleared whenever the corresponding interrupt is serviced.

The information about the interrupt source is indicated in the VSPEC1\_ISTAT register.

IEEE Standard Register=30.17

### Reset Value

0000<sub>H</sub>[illegible]

Field	Bits	Type	Description
CDET	5	RW	<b>Cable Detect Interrupt</b> When active, MDINT is activated upon interrupt from detection of energy on the link. 0 <sub>B</sub> <b>INACTIVE</b> Interrupt is masked out. 1 <sub>B</sub> <b>ACTIVE</b> Interrupt is activated.
TS_FIFO	3	RW	<b>Time Stamp FIFO Interrupt</b> When active, MDINT is activated upon interrupt from either Tx or Rx Time stamp FIFO. 0 <sub>B</sub> <b>INACTIVE</b> Interrupt is masked out. 1 <sub>B</sub> <b>ACTIVE</b> Interrupt is activated.
GMACL_TS	0	RW	<b>Status of Interrupt Request GMACL TS</b> When active, MDINT is activated upon GMACL time stamp valid interrupt. 0 <sub>B</sub> <b>INACTIVE</b> Interrupt is masked out. 1 <sub>B</sub> <b>ACTIVE</b> Interrupt is activated.

This register defines the event source for the MDINT interrupt sent from the GPHY to an external chip based on the mask settings in the VSPEC1\_IMASK register.

IEEE Standard Register=30.18

### Reset Value

0000<sub>H</sub>[illegible]

Field	Bits	Type	Description
CDET	5	ROSC	<b>Cable Detect Interrupt</b> When this bit is set, MDINT is activated upon interrupt from detection of energy on the link. 0 <sub>B</sub> <b>INACTIVE</b> This event is not the interrupt source. 1 <sub>B</sub> <b>ACTIVE</b> The cable detect interrupt is the source of the interrupt.
TS_FIFO	3	ROSC	<b>Time Stamp FIFO Interrupt</b> When this bit is set, MDINT is activated upon interrupt from either Tx or Rx time stamp FIFO. 0 <sub>B</sub> <b>INACTIVE</b> This event is not the interrupt source. 1 <sub>B</sub> <b>ACTIVE</b> The time stamp FIFO interrupt is the source of the interrupt.
GMACL_TS	0	ROSC	<b>Status of Interrupt Request GMACL TS</b> When this bit is set, MDINT is activated upon interrupt from GMACL time stamp valid interrupt. 0 <sub>B</sub> <b>INACTIVE</b> This event is not the interrupt source. 1 <sub>B</sub> <b>ACTIVE</b> The GMACL time stamp is the source of the interrupt.

This register offers a programmable option to map physical lanes A, B, C, and D of the TPI to the ASPs. Each ASP must be mapped to each lane.

### VSPEC1\_LANE\_ASP\_MAP

### ASP Mapping to Physical Lanes (Register 30.20)

00E4<sub>H</sub>

Field	Bits	Type	Description
LANE_D	7:6	RW	<b>Map Physical Lane-D to the ASP</b> 00 <sub>B</sub> <b>ASPA</b> Map Physical Lane-D to the ASP-A 01 <sub>B</sub> <b>ASPB</b> Map Physical Lane-D to the ASP-B 10 <sub>B</sub> <b>ASPC</b> Map Physical Lane-D to the ASP-C 11 <sub>B</sub> <b>ASPD</b> Map Physical Lane-D to the ASP-D
LANE_C	5:4	RW	<b>Map Physical Lane-C to the ASP</b> 00 <sub>B</sub> <b>ASPA</b> Map Physical Lane-C to the ASP-A 01 <sub>B</sub> <b>ASPB</b> Map Physical Lane-C to the ASP-B 10 <sub>B</sub> <b>ASPC</b> Map Physical Lane-C to the ASP-C 11 <sub>B</sub> <b>ASPD</b> Map Physical Lane-C to the ASP-D
LANE_B	3:2	RW	<b>Map Physical Lane-B to the ASP</b> 00 <sub>B</sub> <b>ASPA</b> Map Physical Lane-B to the ASP-A 01 <sub>B</sub> <b>ASPB</b> Map Physical Lane-B to the ASP-B 10 <sub>B</sub> <b>ASPC</b> Map Physical Lane-B to the ASP-C 11 <sub>B</sub> <b>ASPD</b> Map Physical Lane-B to the ASP-D
LANE_A	1:0	RW	<b>Map Physical Lane-A to the ASP</b> 00 <sub>B</sub> <b>ASPA</b> Map Physical Lane-A to the ASP-A 01 <sub>B</sub> <b>ASPB</b> Map Physical Lane-A to the ASP-B 10 <sub>B</sub> <b>ASPC</b> Map Physical Lane-A to the ASP-C 11 <sub>B</sub> <b>ASPD</b> Map Physical Lane-A to the ASP-D

**Time to Enter Low Power (Register 30.21)**

Programmable option to delay the time taken to enter low power mode.  
IEEE Standard Register=30.21

**VSPEC1\_LOW\_POWER\_ENTRY\_TIME** **Reset Value**  
**0001<sub>H</sub>**  
**Time to Enter Low Power (Register 30.21)**

Field	Bits	Type	Description
LPE_TIM	4:0	RW	<b>Low Power Entry Time</b> This is the time taken from detection of no activity on the line to the low power completion. The granularity is 4 seconds and adds 2.4 seconds to 5.6 seconds on to the initial time.

### Fast Retrain Control and Status (Register 30.22)

This register supports fast retrain (FR) as follows:

1. Configures the FR capability (IEEE, CISCO(THPBYP,TXDIS,EXT) [15]).
2. Records the link partner FR capability.
3. Reports the FW resolution of the FR capability.
4. Defines the maximum allowed number of times to try FR before performing a full link down.

IEEE Standard Register=30.22

### VSPEC1\_FRCTL

PW0	7:0	RW	<b>SecureON Password Byte 0</b> Defines byte 0 of the WoL-designated SecureON password to which the PHY is sensitive.

**Wake-on-LAN SecureON Password Byte 2 and 3 (Register 31.3596)**

Wake-on-LAN SecureON Password Byte 2 and 3. Redirected to PCS\_PDI\_WOL\_PWD23.  
IEEE Standard Register=31.3596

**VPSPEC2\_WOL\_PW23** **Reset Value**  
**0000<sub>H</sub>**  
**Wake-on-LAN SecureON Password Byte 2 and 3 (Register 31.3596)**

Field	Bits	Type	Description
PW3	15:8	RW	<b>SecureON Password Byte 3</b> Defines byte 3 of the WoL-designated SecureON password to which the PHY is sensitive.
PW2	7:0	RW	<b>SecureON Password Byte 2</b> Defines byte 2 of the WoL-designated SecureON password to which the PHY is sensitive.

IEEE Standard Register=31.3597

### Reset Value

0000<sub>H</sub>

Field	Bits	Type	Description
PW5	15:8	RW	<b>SecureON Password Byte 5</b> Defines byte 5 of the WoL-designated SecureON password to which the PHY is sensitive.
PW4	7:0	RW	<b>SecureON Password Byte 4</b> Defines byte 4 of the WoL-designated SecureON password to which the PHY is sensitive.

## 7 Electrical Characteristics

This chapter provides the electrical characteristics for the MxL86252I.

### 7.1 Absolute Maximum Ratings

**Table 40** shows the absolute maximum ratings for the MxL86252I.

**Table 40 Absolute Maximum Ratings**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Storage Temperature Limits	$T_{STG}$	-55.0	—	125.0	°C	—
Soldering Temperature	$T_{SOL}$	—	—	260.0	°C	Compliance with lead free re-flow soldering profile as J-STD-020D
Moisture Level 3 Temperature Limits	$T_{ML3}$	—	—	260.0	°C	According to IPS J-STD 020
Absolute Junction Temperature	$T_{JABS}$	-40.0		125	°C	The thermal solution must ensure that $T_J$ never exceeds $T_{JABS}$ maximum. The chip resets the device when $T_J > T_{JABS}$ maximum to prevent any damage to occur.
DC Voltage Limits on VDD3V3PAD1, VDD3V3PAD2 Pins	$V_{DDP3V3}$	-0.5	—	+3.63	V	Generic ball $V_{HIGH}$ supply
DC Voltage Limits on VDDP_PAD Pins when Ball K4 Pin Strap PS_MDIO_VOLTAGE is HIGH	$V_{DDP}$	-0.5	—	+3.63	V	Multi voltage ball $V_{HIGH}$ supply
DC Voltage Limits on VDDP_PAD Pins when Ball K4 Pin Strap PS_MDIO_VOLTAGE is LOW	$V_{DDP}$	-0.5	—	+1.98	V	Multi voltage ball supply. 1.8 V supply dedicated to MDIO pins in lower mode
DC Voltage Limits on VDDA3V3_0, VDDA3V3_1, VDDA3V3_2, VDDA3V3_3, VDDA3V3_4 Pins	$V_{DDA3V3}$	-0.5	—	+3.63	V	Chip analog $V_{HIGH}$ supply
DC Voltage Limits on VDDA1V8_0, VDDA1V8_1 Pins	$V_{DDA1V8}$	-0.5	—	+1.98	V	Chip analog supply
DC Voltage Limits on VDDA1V8PORXO, VDDA1V8_PVT, VCC1V8_OTP, and VDDA1V8_CML Pins	$V_{DDA1V8PORXO}$ $V_{DDA1V8PVT}$ $V_{CC1V8OTP}$ $V_{DDA1V8CML}$	-0.5	—	+1.98	V	Chip clocking supply

**Electrical Characteristics**
**Table 40 Absolute Maximum Ratings (cont'd)**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
DC Voltage Limits on VPHA1V8_0, VPHA1V8_1, and VDDA1V8_PLL Pins	$V_{PH}$ $V_{DDA1V8PLL}$	-0.5	—	+1.98	V	USXGMII, LJ PLL $V_{HIGH}$ supply
DC Voltage Limits on VDDA1V2CDB0, VDDA1V2CDB1 Pins	$V_{DDA1V2CDB}$	-0.5	—	+1.32	V	Chip analog supply
DC Voltage Limits on VDDA0V8_0, VDDA0V8_1, VDDD0V8REF, VDDD0V8POST, and VDDA0V8_CML Pins	$V_{DDA0V8}$ $V_{DDD0V8PLL}$ $V_{DDA0V8CML}$	-0.5	—	+0.89	V	Chip analog $V_{LOW}$ supply, LJ PLL $V_{LOW}$ supply
DC Voltage Limits on VDDD0V8_COR Pins	$V_{DD}$	-0.5	—	+0.89	V	Chip core supply
DC Voltage Limits on VA0V8_0, VA0V8_1 Pins	$V_P$	-0.5	—	+0.89	V	USXGMII $V_{LOW}$ supply
DC Voltage Limits on Any Other Pins <sup>1)</sup> with Respect to Ground	$V_{DC}$	-0.5	—	$V_{DDP3V3} + 0.5$	V	Unless specified otherwise
XTAL1 Input Voltage	$V_{XTAL1}$	-0.30	—	2.0	V	—
ESD HBM Robustness	$V_{ESD,HBM}$	—	—	1000.0	V	According to ANSI/ESDA/JEDEC JS-001-2014
ESD CDM Robustness	$V_{ESD,CDM}$	—	—	250.0	V	According to ANSI/ESDA/JEDEC JS-002-2014

1) Any pin that is not a supply pin out of one of the domains:  $V_{DDP}$ ,  $V_{PH}$ ,  $V_P$ ,  $V_{DDA3V3}$ ,  $V_{DDA1V8PORXO}$ ,  $V_{DDA1V2CDB}$ ,  $V_{DDA0V8}$ ,  $V_{DD}$ , and  $V_{DDA1V8}$ .

**Attention: Stresses above the maximum values listed in this table may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the device.**

## 7.2 Operating Range

**Table 41** defines the limit values of voltages and temperature which may be applied to guarantee proper operation of the MxL86252I.

**Table 41 Operating Range**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Ambient Temperature under Bias	$T_A$	-40.0	–	85.0	°C	The thermal design must ensure that the maximum junction temperature is not exceeded. The use of a heat sink may be suitable.
Junction Temperature	$T_j$	–	–	110.0	°C	Thermal solution must ensure that $T_j$ remains within operating range and never exceeds maximum absolute ratings ( $T_{JABS}$ ).
Generic Pin Supply Voltage	$V_{DDP3V3}$	3.14	3.30	3.46	V	Generic pin $V_{HIGH}$ supply
Multi Voltage Pin Supply Voltage for MDIO Signals when Ball K4 Pin Strap PS_MDIO_VOLTAGE is HIGH	$V_{DDP}$	3.14	3.30	3.46	V	Multi voltage pin $V_{HIGH}$ supply
Multi Voltage Pin Supply Voltage for MDIO Signals when Ball K4 Pin Strap PS_MDIO_VOLTAGE is LOW	$V_{DDP}$	1.71	1.80	1.89	V	Multi voltage pin supply. 1.8 V supply dedicated to MDIO pins in lower mode
Analog High Supply Voltage	$V_{DDA3V3}$	3.14	3.30	3.46	V	Chip analog $V_{HIGH}$ supply
XO Supply Voltage	$V_{DDA1V8POR}$ XO	1.71	1.80	1.89	V	Chip clocking $V_{HIGH}$ supply
Analog Medium Supply Voltage	$V_{DDA1V8}$	1.71	1.80	1.89	V	Chip analog $V_{MED}$ supply
CDB Supply Voltage	$V_{DDA1V2CDB}$	1.14	1.20	1.26	V	Chip analog supply
USXGMII High Supply Voltage	$V_{PH}$	1.71	1.80	1.89	V	USXGMII $V_{HIGH}$ supply
LJ PLL High Supply Voltage	$V_{DDA1V8PLL}$	1.71	1.80	1.89	V	LJ PLL $V_{HIGH}$ supply
Analog Low Supply Voltage	$V_{DDA0V8}$	0.81	0.85	0.89	V	Chip analog $V_{LOW}$ supply
LJ PLL Low Supply Voltage	$V_{DDD0V8PLL}$	0.81	0.85	0.89	V	LJ PLL $V_{LOW}$ supply
Chip Core Supply Voltage	$V_{DD}$	0.81	0.85	0.89	V	Chip core supply
USXGMII Low Supply Voltage	$V_P$	0.81	0.85	0.89	V	USXGMII $V_{LOW}$ supply
Ground	$V_{SS}$	0.00	0.00	0.00	V	–

**Attention: Operations above the maximum values listed here for extended periods may adversely affect long-term reliability of the device.**

### 7.3 Typical Power Consumption

**Table 42** lists the typical power consumption for different modes. Typical power is the power consumed by a nominal process device, nominal supply voltages, at 25°C ambient temperature and a CAT5e link segment.

The conditions for Link-up are full speed and bidirectional, full duplex traffic on all 5 ports. There are 10G links on both SerDes interfaces. The switch operates at 32.5 Gbps wirespeed with 7 ports.

**Table 42 Typical Power Consumption**

Conditions: 25°C	3.3 V $V_{HIGH}$ Domain Current	1.8 V Domain Current	1.2 V Domain Current	0.85 V $V_{LOW}$ Domain Current	0.85 V $V_P$ Domain Current	Chip Power
Unit	mA	mA	mA	mA	mA	W
2500BASE-T Link-up, 100 m Cable	242	133	292	2751	125	3.8
2500BASE-T Link-up, 30 m Cable	223	132	276	2458	126	3.5
2500BASE-T EEE	187	123	85	1127	127	2.0
1000BASE-T Link-up, 100 m Cable	198	129	271	1475	125	2.6
1000BASE-T EEE	27	128	71	677	128	1.1
100BASE-TX Link-up, 100 m Cable	78	121	71	964	124	1.5
100BASE-TX EEE	31	118	75	543	130	1.0
10BASE-Te Link-up, 100 m Cable	86	123	42	928	118	1.4
Cable Unplugged - ANEG	48	126	40	532	121	1.0
Cable Unplugged - Low Power	27	115	4	337	119	0.7
Reset	1	23	1	60	0	0.1

### 7.4 Maximum Thermal Design Power

**Table 43** lists the maximum Thermal Design Power (TDP). The TDP is the power consumption for a full traffic load and worst-case process, supply voltage, cable, and temperature conditions. This value is relevant to design the thermal solution.

**Table 43 Maximum Power Consumption**

Condition	Maximum Power (W)
Maximum Chip Power at Maximum Operating Range	5.7

*Note: With a properly designed thermal solution (heat sink), it is unlikely that  $T_j$  exceeds the maximum operating junction temperature. An excess is reported in the MDIO register VSPEC1\_TEMP\_STA and the STA can initiate a renegotiation to a lower link rate to get  $T_j$  back into the operating temperature range if ADS is disabled.*

### 7.5 Maximum Current

**Table 44** provides the maximum current to dimension the power supply. It is the maximum current consumption per rail for a full traffic load and worst-case process, supply voltage and temperature conditions that may occur in any operating state of the device. The maximum current can be higher than the steady state current, for instance in training phases of the internal filters.

Electrical Characteristics

**Table 44** Maximum Current Per Rail

3.3 V Domain Current	1.8 V Domain Current	1.2 V Domain Current	0.85 V V <sub>LOW</sub> Domain Current	0.85 V V <sub>P</sub> Domain Current
mA	mA	mA	mA	mA
303	143	370	4822	198

## 7.6 DC Characteristics

These sections document the DC characteristics of the MxL86252I external interfaces.

### 7.6.1 Digital Interfaces

This section defines the DC characteristics of the GPIO interface as follows:

- General Purpose IO
- MDIO
- QSPI
- UART
- I<sup>2</sup>C
- Interrupts
- Clock Input and Outputs
- LED
- JTAG
- HRSTN

**Table 45** summarizes the DC characteristics for  $V_{DDP} = 3.3\text{ V}$ .

**Table 45 DC Characteristics of the GPIO Interfaces ( $V_{DDP} = 3.3\text{ V}$ )**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Input High Voltage	$V_{IH}$	$0.7 \cdot V_{DDP}$	—	$V_{DDP} + 0.3$	V	—
Input Low Voltage	$V_{IL}$	−0.3	—	$0.3 \cdot V_{DDP}$	V	—
Output High Voltage	$V_{OH}$	$V_{DDP} - 0.4$	—	—	V	$I_{OH} = 2, 4, 8, 12\text{ mA}$
Output Low Voltage	$V_{OL}$	—	—	0.4	V	$I_{OL} = 2, 4, 8, 12\text{ mA}$

**Table 46** summarizes the DC characteristics for  $V_{DDP} = 1.8\text{ V}$ .

**Table 46 DC Characteristics of the GPIO Interfaces ( $V_{DDP} = 1.8\text{ V}^{1)}$ )**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Input High Voltage	$V_{IH}$	$0.65 \cdot V_{DDP}$	—	$V_{DDP} + 0.3$	V	—
Input Low Voltage	$V_{IL}$	−0.3	—	$0.35 \cdot V_{DDP}$	V	—
Output High Voltage	$V_{OH}$	$V_{DDP} - 0.4$	—	—	V	$I_{OH} = 2, 4, 8, 12\text{ mA}$
Output Low Voltage	$V_{OL}$	—	—	0.4	V	$I_{OL} = 2, 4, 8, 12\text{ mA}$

1) 1.8V is only applicable to the pins specified in **PS\_MDIO\_VOLTAGE** of **Table 18**.

### 7.6.2 Twisted Pair Interface

The TPI conforms to the specifications of 10BASE-Te (Clause 14), 100BASE-TX (Clause 25), 1000BASE-T (Clause 40), and 2.5GBASE-T (Clause 126) given in IEEE 802.3, and ANSI X3.263-1995.

### 7.6.3 Built-in Temperature Sensor

**Table 47** provides the parameters of the integrated temperature sensor.

**Table 47 Temperature Sensor Characteristics**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Temperature Range	T <sub>range</sub>	-40		125	°C	The thermal mitigation measures must ensure that T <sub>j</sub> remains within the operating range. When T <sub>j</sub> exceeds the maximum ratings, the device performs a self-reset to prevent damage.
Resolution		–	12	–	bits	–
Accuracy		-3	–	+3	°C	Without calibration

## 7.7 AC Characteristics

The AC characteristics of the external interfaces are specified under these operating conditions:

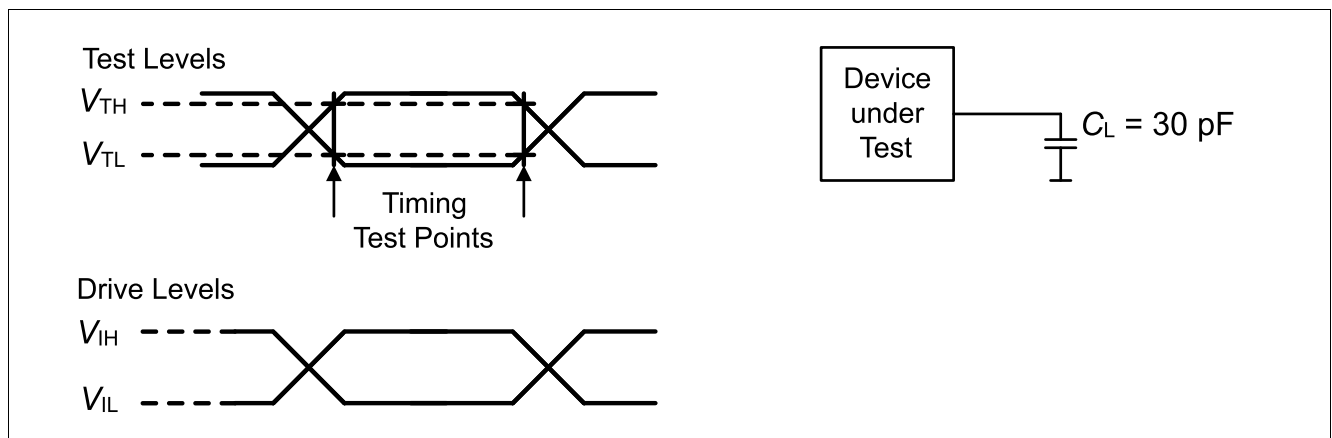

$$T_A = -40 \text{ to } 85^\circ\text{C}$$

$$V_{DDP} = 3.3 \text{ V} \pm 5\%$$

$$V_{SS} = 0 \text{ V}$$

The timing measurements are made at minimum  $V_{IH}$  for a logical 1 and at maximum  $V_{IL}$  for a logical 0. See [Table 45](#) and [Table 46](#) for more details.

[Figure 24](#) shows the AC testing input/output waveforms. The load capacitors are according to the specific interface standard. All non-specified interfaces use 30 pF as assumed loading.

**Figure 24** Input/Output Waveform for AC Tests

### 7.7.1 Power Up Sequence

All  $V_{HIGH}$ ,  $V_{PH}$ ,  $V_{DDA}$ ,  $V_P$ , and  $V_{LOW}$  are supplied externally.

In this section, for the sake of simplicity:

- All 3.3 V supplies are represented as  $V_{HIGH}$ .
- All 1.8 V supplies are represented as  $V_{PH}$ .
- All 1.2 V supplies are represented as  $V_{DDA}$ .
- The 0.85 V analog supply of SerDes is represented as  $V_P$ .
- The rest of the 0.85 V supplies are represented as  $V_{LOW}$ .

All the supply domains  $V_{HIGH}$ ,  $V_{PH}$ ,  $V_{DDA}$ ,  $V_P$ , and  $V_{LOW}$ , and the input reference clock must be stabilized before releasing the reset HRSTN.

There is no known voltage rail power up sequence except that  $V_{HIGH}$  must be ramped up and stable before  $V_{PH}$  is ramped up,  $V_{LOW}$  must be ramped up and stable before  $V_P$  is ramped up, and  $V_{LOW}$  must be ramped up and stable before  $V_{PH}$  is ramped up. MaxLinear recommends implementing the power-up sequence defined in the reference board. Refer to the relevant hardware documentation available at <https://maxlinear.com/myMxL> for more information on the power circuitry.

The MxL86252I supports an asynchronous hardware reset HRSTN. [Table 48](#) lists the timing requirements of the power supply pins. The timings refer to the signal sequence waveforms depicted in [Figure 25](#).

When PS\_MDIO\_VOLTAGE is low,  $V_{DDP}$  is treated as  $V_{PH}$ .

When PS\_MDIO\_VOLTAGE is high,  $V_{DDP}$  is treated as  $V_{HIGH}$ .

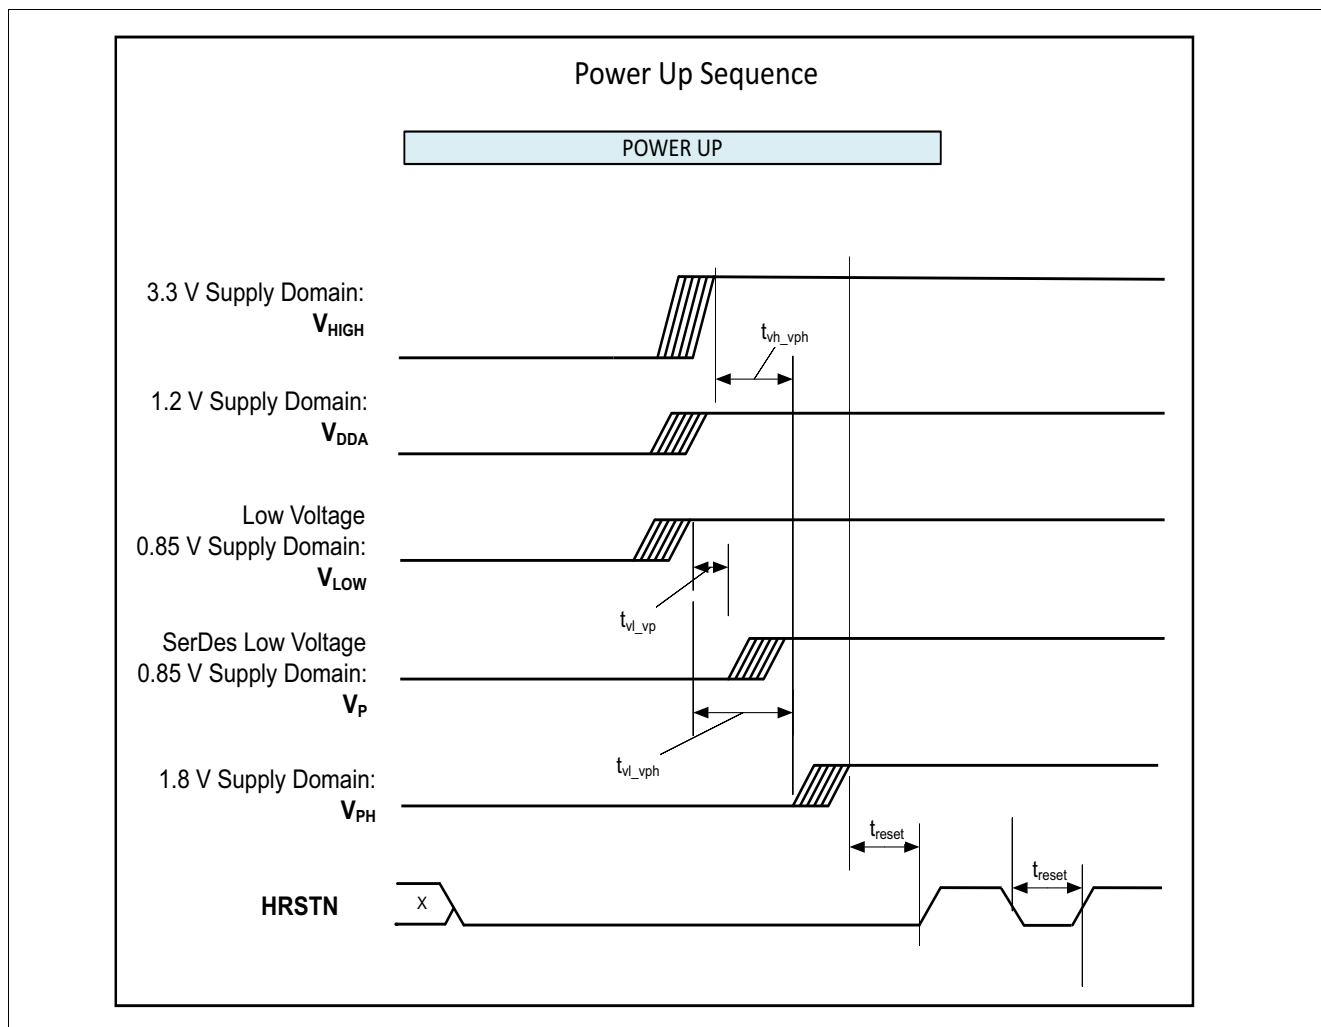

Figure 25 Timing Diagram for the Reset Sequence

Table 48 Power Supply Timings

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Delay between $V_{HIGH}$ and $V_{PH}$ Domains Voltage Ramp Up	$t_{vh\_vph}$	50	-	-	$\mu s$	The $V_{PH}$ voltage must never be higher than $V_{HIGH}$ voltage
Delay between $V_{LOW}$ and $V_P$ Domains Voltage Ramp Up	$t_{vl\_vp}$	1	-	-	$\mu s$	The $V_P$ voltage must never power up before $V_{LOW}$ voltage.
Delay between $V_{LOW}$ and $V_{PH}$ Domains Voltage Ramp Up	$t_{vl\_vph}$	50	-	-	$\mu s$	The $V_{PH}$ voltage must never power up before $V_{LOW}$ voltage.
Reset Time after all Voltage Domains are Stabilized	$t_{reset}$	100	-	-	ns	HRSTN must be released after the power supplies stabilized.

## 7.7.2 Input Clock

**Table 49** lists the input clock requirements when not using a crystal, for example when an external reference clock is injected into the XTAL1 pin of the MxL86252I, such as nominal frequency, frequency deviation, duty cycle, and signal characteristics. When a crystal is applied to generate the reference clock using the integrated XO, the clock requirements stated here are explicitly met as long as the specification for the crystal is satisfied.

**Table 49 AC Characteristics of Input Clock on XTAL1 Pin**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Frequency with 25 MHz Input	$f_{clk25}$	–	25.0	–	MHz	–
Frequency with 50 MHz Input	$f_{clk50}$	–	50.0	–	MHz	–
Frequency Deviation <sup>1)</sup>		-50.0	–	+50.0	ppm	–
Duty Cycle		40.0	50.0	60.0	%	–
Rise/Fall Times with 25 MHz Input		–	–	10.0	ns	25 MHz
Rise/Fall Times with 50 MHz Input		–	–	5.0	ns	50 MHz
Input Long Term Jitter (Jrms)		–	–	2.0	ps	1 kHz to 10 MHz
Input Voltage Swing		300.0	–	–	mV	Peak to Peak value
Input Voltage		0	–	1.8	V	–

1) Including the frequency stability tolerance due to temperature, and aging effects over the product lifetime.

## 7.7.3 Power Supply Rail Requirements

**Table 50** lists the required characteristics of the power supplies. The definitions of the power supply rails are the same as that described in [Section 7.7.1](#).

**Table 50 AC Characteristics of the Power Supply**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Power Supply Ripple on $V_P$	$R_{VP}$	–	–	40.0	mV	Peak to Peak value See <a href="#">Figure 26</a> .
Power Supply Ripple on $V_{LOW}$	$R_{VLOW}$	–	–	40.0	mV	Peak to Peak value
Power Supply Ripple on $V_{DDA}$	$R_{VDDA}$	–	–	50.0	mV	Peak to Peak value
Power Supply Ripple on $V_{HIGH}$	$R_{VHIGH}$	–	–	50.0	mV	Peak to Peak value
Power Supply Ripple on $V_{PH}$	$R_{VPH}$	–	–	50.0	mV	Peak to Peak value Max. 18 mV peak to peak for any noise in 200 kHz to 100 MHz range. See <a href="#">Figure 27</a> .

### 7.7.3.1 $V_P$ AC and DC Power Supply Recommendations

This section contains the  $V_P$  supply power requirements.

**Figure 26 DC and AC Characteristics for  $V_P$  Supply**

#### DC Characteristics

- Operating range: See the range of  $V_P$  in [Table 41](#)
- Frequency range: 0 to 100 kHz
- Recommendations:
  - The overshoot or undershoot of the low-frequency supply caused by the board filter network should be lower than 100 kHz.
  - The overall DC budget should account for the low frequency overshoot/undershoot in addition to the board plus package IR drop.
  - There is a transition zone between 10 kHz and 100 kHz in which it is possible for the supply noise to increase as the frequency decreases at a rate of 20 dB/Dec up to the maximum of the operating range.

#### AC Characteristics

- Max 5% (peak-to-peak) of the DC level for all noise greater than 100 kHz
- Recommendations:
  - A switching supply can be used until the overall noise limits (including, the self noise) are met.

### 7.7.3.2 $V_{PH}$ AC and DC Power Supply Recommendations

This section contains the  $V_{PH}$  supply power requirements.

**Figure 27 DC and AC Characteristics for  $V_{PH}$  Supply**

#### DC Characteristics

- Operating range: See the range of  $V_{PH}$  in [Table 41](#)
- Frequency range: 0 to 100 kHz
- Recommendations:
  - The overshoot or undershoot of the low-frequency supply caused by the board filter network should be lower than 100 kHz.
  - The overall DC budget should account for the low frequency overshoot/undershoot in addition to the board plus package IR drop.
  - There is a transition zone between 10 kHz and 100 kHz in which it is possible for the supply noise to increase as the frequency decreases at a rate of 20 dB/Dec up to the maximum of the operating range.

#### AC Characteristics

- 100 kHz to 200 kHz: A maximum value of 3% ripple (peak-to-peak) of the DC level is allowed for all noise in this region.
- 200 kHz to 100 MHz: A maximum value of 1% ripple (peak-to-peak) of the DC level is allowed in this region.
- 100 MHz and above: A maximum value of 3% ripple (peak-to-peak) of the DC level is allowed for all noise in this region.
- Recommendations:
  - Use an LDO as a switching supply.
  - When using a switching power supply for  $V_{PH}$ , ensure that the 200 kHz to 100 MHz ripple requirements are met. Switching power supplies' tone and harmonics typically occur in this region.
  - Do not share this power rail directly with any other noisy circuitry.
  - Follow the relevant hardware documentation available at <https://maxlinear.com/myMxL> on the power circuitry.

### 7.7.4 MDIO Slave Interface

Figure 28 shows a timing diagram of the MDIO slave interface for a clock cycle in the read, write, and turnaround mode, respectively. The timing measures are annotated. Table 51 summarizes the defined absolute values.

Figure 28 Timing Diagram for the MDIO Slave Interface

Table 51 Timing Characteristics of the MDIO Slave Interface

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
MDC High Time	$t_{CH}$	10.0	—	—	ns	The MDC signal must conform to the specified MDC timings when measured at the MxL86252I's MDC_S pin.
MDC Low Time	$t_{CL}$	10.0	—	—	ns	
MDC Clock Period	$t_{CP}$	40.0	400.0	—	ns	
MDC Clock Frequency <sup>1)</sup>	$t_{CP}$	—	2.5	25.0	MHz	
MDC Rise Time	$t_R$	—	—	5.0	ns	
MDC Fall Time	$t_F$	—	—	5.0	ns	
MDIO Input Setup Time Subject to ↑ MDC	$t_S$	10.0	—	—	ns	MxL86252I Receive
MDIO Input Hold Time Subject to ↑ MDC	$t_H$	10.0	—	—	ns	MxL86252I Receive
MDIO Output Delay Time Subject to ↑ MDC	$t_D$	0.0	—	10	ns	MxL86252I Transmit
Standard at 2.5 MHz						
MDIO Output Delay Subject to ↑ MDC	$t_D$	0.0	—	300.0	ns	PHY Transmit

1) The MDC clock supports a range of frequencies up to 25 MHz. The default/typical frequency is 2.5 MHz.

### 7.7.5 MDIO Master Interface

**Figure 29** shows the timing diagram of the MDIO master interface for a clock cycle in the read-, write- and turnaround-mode, respectively. The timing measures are annotated. **Table 52** summarizes the defined absolute values.

**Figure 29** Timing Diagram for the MDIO Master Interface

**Table 52** Timing Characteristics of the MDIO Master Interface

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
MDC High Time	$t_{CH}$	5.0	–	–	ns	Given timings are all subject to the MDC at the pin of the MxL86252I.
MDC Low Time	$t_{CL}$	5.0	–	–	ns	
MDC Clock Period	$t_{CP}$	20.0	400.0	–	ns	
MDC Clock Frequency <sup>1)</sup>	$t_{CP}$	–	2.5	50.0	MHz	
MDC Rise Time	$t_R$	–	–	2.5	ns	
MDC Fall Time	$t_F$	–	–	2.5	ns	
MDIO Input Setup Time Subject to - MDC	$t_S$	8.0	–	–	ns	MAC receive
MDIO Input Hold Time Subject to - MDC	$t_H$	0.0	–	–	ns	MAC receive
MDIO Output Setup Time Subject to - MDC	$t_S$	7.0	–	–	ns	MAC transmit
MDIO Output Hold Time Subject to - MDC	$t_H$	7.0	–	–	ns	MAC transmit
<b>Standard</b>						
MDIO Output Delay Subject to - MDC	$t_D$	0.0	–	300.0	ns	PHY transmit
MDIO Output Setup Time Subject to - MDC	$t_S$	10.0	–	–	ns	MAC transmit
MDIO Output Hold Time Subject to - MDC	$t_H$	10.0	–	–	ns	MAC transmit

1) MDC clock supports range of frequencies, up to 50 MHz. Default/typical frequency is 2.5 MHz.

## 7.7.6 Quad Serial Peripheral Interface (QSPI)

Figure 30 shows the QSPI master timing.

Figure 30 QSPI Master Interface Timing

Table 53 QSPI Interface Timing Parameters

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Master Mode						
TX Data Output Hold	$T_{oh}$	5%	—	—	Tclk	For Tclk = 20 ns
Tx Data Output Delay	$T_{ov}$	0	—	50%	Tclk	For Tclk = 20 ns
Rx Data Input Setup time	$T_{is}$	35%	—	—	Tclk	For Tclk = 20 ns
Rx Data Hold Time	$T_{ih}$	5%	—	—	Tclk	For Tclk = 20 ns
SPI Clock Period (Master Mode)	$T_{clk}$	9.846	—	—	ns	Maximum 101.5625 MHz
SPI Clock Rising	$S_7$	0.1	—	—	V/ns	—
SPI Clock Falling	$S_6$	0.1	—	—	V/ns	—

### 7.7.7 I<sup>2</sup>C Interface

Figure 31 shows the I<sup>2</sup>C interface timing.

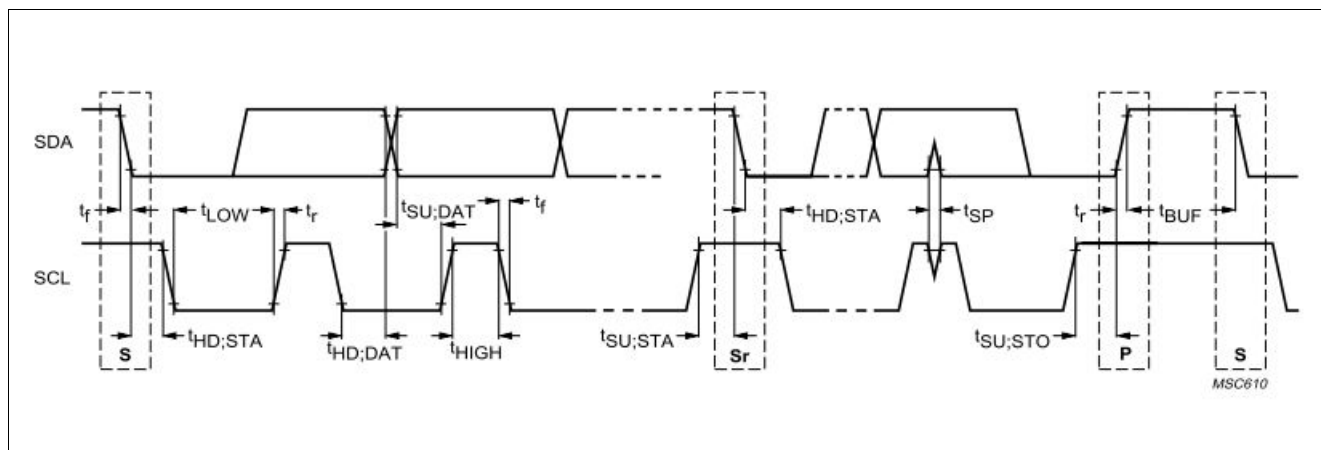

Figure 31 I<sup>2</sup>C Timing

Table 54 describes the timing values.

Table 54 I<sup>2</sup>C Timing

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
SCL Frequency	$f_{SCL}$	0	—	100	kHz	—
Setup Time Data to Shift Clock	$t_{SU,DAT}$	250	—	—	ns	—
Hold Time Data to Shift Clock	$t_{HD,DAT}$	0	—	3.45	μs	—
Setup Time START to Shift Clock	$t_{SU,STA}$	4700	—	—	ns	—
Hold Time START, STOP to Shift Clock	$t_{HD,STA/STO}$	4.0	—	—	μs	—
Low Time	$t_{LOW}$	4700	—	—	ns	—
High Time	$t_{HIGH}$	4000	—	—	ns	—
Rising Time	$t_r$	—	—	1000	ns	—
Falling Time	$t_f$	—	—	300	ns	—
Bus Free Time	$t_{BUF}$	4700	—	—	ns	—

## 7.7.8 JTAG Interface

The JTAG test interface is used for debugging the CPU and boundary scan.

**Figure 32 Test Interface Timing**

[Table 55](#) and [Table 56](#) describe the timing values for the test interface.

**Table 55 Test Interface Clock**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
TCK Clock Period	$t_C$	100	—	—	ns	—
TCK High Time	$t_{CH}$	40	—	—	ns	—
TCK Low Time	$t_{CL}$	40	—	—	ns	—

**Table 56 JTAG Timing**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
TMS Setup Time	$t_{MS}$	40	—	—	ns	—
TMS Hold Time	$t_{MH}$	40	—	—	ns	—
TDI Setup Time	$t_{DS}$	40	—	—	ns	—
TDI Hold Time	$t_{DH}$	40	—	—	ns	—
Hold: TRSTN After TCK	$t_{HD}$	10	—	—	ns	—
TDO Valid Delay	$t_{DV}$	—	—	60	ns	—

### 7.7.9 USXGMII Interface Characteristics

This section describes the AC characteristics of the USXGMII interface on the MxL86252I.

The USXGMII interface characteristics are described in:

- USXGMII transmit characteristics ([Section 7.7.9.1](#))
- USXGMII receive characteristics ([Section 7.7.9.2](#))

#### 7.7.9.1 USXGMII Transmit Characteristics

[Table 57](#) shows the requirements of the USXGMII interface on the MxL86252I.

**Table 57 Transmit Characteristics of the USXGMII**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Reference Differential Impedance	$Z_d$	—	100	—	$\Omega$	—
Termination Mismatch	$R_M$	—	—	5	%	—
DC Common Mode Voltage	$V_{cm}$	0	—	3.6	V	—
Output Rise and Fall Time	$t_{RH}, t_{FH}$	24	—	—	ps	20%→80%
Output AC Common Mode Voltage	—	—	—	15	mV	mV (RMS)
Differential Output Return Loss <sup>1)</sup>	SDD22	20	—	—	dB	0.05-0.1 GHz
		10	—	—	dB	0.1-7.5 GHz
		—	—	—		7.5-15 GHz
Common Mode Output Return Loss <sup>2)</sup>	SCC22	6	—	—	dB	0.1-15 GHz

1) Return loss given by equation  $SDD22(dB) = 10 - 16.6 \log_{10}(f/7.5)$ , with f in GHz.

2) Common mode reference impedance is 25  $\Omega$  common mode return loss helps absorb reflections and noise for EMI.

#### 7.7.9.2 USXGMII Receive Characteristics

[Table 58](#) shows the requirements of the USXGMII interface on the MxL86252I.

**Table 58 Receive Characteristics of the USXGMII**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Reference Differential Impedance	$Z_d$	—	100	—	$\Omega$	—
Termination Mismatch	$Z_M$	—	—	5	%	—
AC Common Mode Voltage	—	—	—	25	mV	mV (RMS)
Differential Output Return Loss <sup>1)</sup>	SDD11	20	—	—	dB	0.05-0.1 GHz
		10	—	—	dB	0.1-7.5 GHz
		—	—	—		7.5-15 GHz
Common Mode Input Return Loss <sup>2)</sup>	SCC11	6	—	—	dB	0.1-15 GHz
Differential to Common Mode Input Conversion <sup>2)</sup>	SCD11	12	—	—	dB	0.1-15 GHz

1) Return loss given by equation  $SDD11(dB) = 10 - 16.6 \log_{10}(f/7.5)$ , with f in GHz.

2) Common mode reference impedance is 25  $\Omega$ . SCD11 relates to conversion of differential to common mode and the associated generation of EMI.

### 7.7.10 Differential Reference Clock Interface

**Table 59** describes the CML differential reference clock output.

**Table 59 Reference Clock Output Characteristics**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Reference Clock Frequency	–	-300	–	+300	ppm	–
Clock Rising Edge Rate	$t_{rise}$	0.62	1	2	V/ns	-150 mv to 150 mv
Clock Falling Edge Rate	$t_{fall}$	0.62	1	2	V/ns	-150 mv to 150 mv
Peak to Peak Jitter	$t_{ppjitter}$	0.5	1.2	1.7	ps	100 mV power noise on 1.8 V
Clock Duty Cycle	-	45	50	55	%	–
Output Voltage High	-	0.25	0.4	0.5	V	–
Output Voltage Low	-	0	0.05	0.1	V	–
Differential Output Voltage	-	500	–	900	mV	$2 *  V_{CLKP} - V_{CLKN} $
Termination	-	45	–	60	$\Omega$	

### 7.7.11 Crystal Specification

The 25 MHz crystal must follow the specification given in [Table 60](#).

**Table 60** Specification of the Crystal

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Frequency with 25 MHz Input	$f_{clk25}$	–	25.0	–	MHz	–
Total Frequency Stability	–	-50	–	+50	ppm	Refers to the sum of all effects: such as general tolerance, aging, and temperature dependency
Series Resonant Resistance	–	–	–	40	$\Omega$	–
Drive Level	–	–	0.1	0.2	mW	–
Load Capacitance	$C_L$	16	–	26	pF	–
Shunt Capacitance	$C_0$	–	–	7	pF	–

## 7.8 External Circuitry

This section specifies the component characteristics of the external circuitry connected to the TPIs of the MxL86252I.

### 7.8.1 Twisted-Pair Common-Mode Rejection and Termination Circuitry

Figure 33 shows the external circuitry necessary to properly terminate the common mode of the TPI.

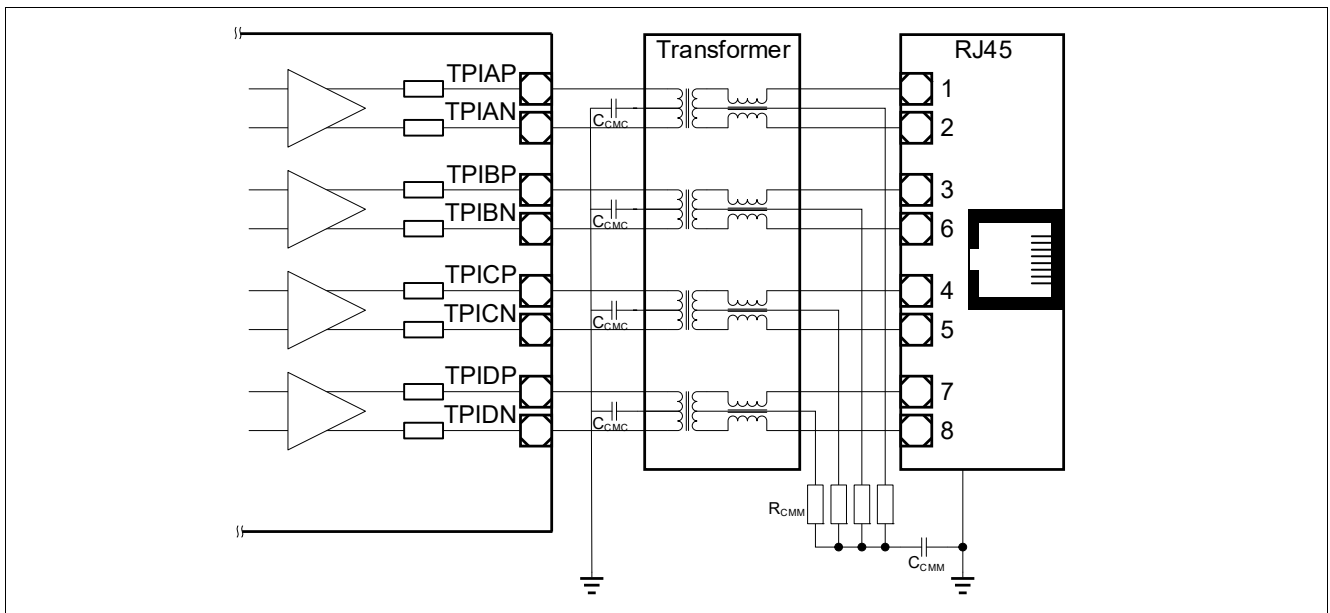

Figure 33 Twisted Pair Common-Mode Rejection and Termination Circuitry

Table 61 defines the component values and their supported tolerances.

Table 61 Electrical Characteristics for Common-Mode Rejection and Termination Circuitry

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Common-Mode Decoupling Capacitance (Media End)	$C_{CMM}$	800	1000	1200	pF	±15%, 3 kV
Common-Mode Decoupling Capacitance (Chip End)	$C_{CMC}$	80	100	120	nF	±15%, 25 V
Common-Mode Termination Resistance (Media End)	$R_{CMM}$	67.5	75	82.5	Ω	±5%

## 7.8.2 Transformer (Magnetics)

This section specifies the required electrical characteristics of the transformer<sup>1)</sup> devices that are supported. The specifications listed here guarantee proper operation according to IEEE 802.3 [6].

Figure 34 depicts a typical Gigabit Ethernet capable transformer device.

Figure 34 Schematic of an Ethernet Transformer Device

Table 62 lists the characteristics of the supported transformer devices. These characteristics represent the minimum values for achieving standard performance. Since the transformer significantly impacts the link performance, it is possible to increase the loop reach by selecting transformers with improved parameters.

Table 62 Electrical Characteristics for Supported Transformers (Magnetics)

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Turns Ratio	1:tr	0.95	1.00	1.05		±5%
Differential-to-Common-mode Rejection	DCMR	40	–	–	dB	30 MHz
		35	–	–	dB	60 MHz
		30	–	–	dB	100 MHz
Crosstalk Attenuation	CTA	45	–	–	dB	30 MHz
		40	–	–	dB	60 MHz
		35	–	–	dB	100 MHz
Insertion Loss	IL	–	–	1	dB	1 MHz ≤ f ≤ 250 MHz
Return Loss	RL	16	–	–	dB	1 MHz ≤ f ≤ 40 MHz
Return Loss	RL	16-10*log <sub>10</sub> (f/40)	–	–	dB	40 MHz ≤ f ≤ 250 MHz

1) Also often referred to as magnetics.

### 7.8.3 RJ45 Plug

**Table 63** describes the electrical characteristics of the RJ45 plug to be used in conjunction with MxL86252I.

**Table 63 Electrical Characteristics for Supported RJ45 Plugs**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Crosstalk Attenuation	CTA	45	–	–	dB	30 MHz
		40	–	–	dB	60 MHz
		35	–	–	dB	100 MHz
Insertion Loss	IL	–	–	1	dB	1 MHz ≤ f ≤ 250 MHz
Return Loss	RL	16	–	–	dB	1 MHz ≤ f ≤ 40 MHz
Return Loss	RL	16-10*log <sub>10</sub> (f/40)	–	–	dB	40 MHz ≤ f ≤ 250 MHz

## 8 Package Outline

The product is assembled in a PG-FCLBGA-277 package, which complies with regulations requiring lead free material. [Table 64](#) lists the parameters generated in accordance with JEDEC JESD51 standards [\[10\]](#).

**Table 64 JEDEC Thermal Resistance Package Parameter - Compact 2-R Model Network**

Item	Name/Value
Thermal Resistance - Junction to Case Top	$R_{th, JCTop} = 0.082 \text{ K/W}$
Minimum Thermal Resistance - Junction to 0 mm from package edge on PCB	$R_{th, JB} = 2.70 \text{ K/W}$

**Table 65 Stress Force Package Parameter**

Item	Value
Force	1.939 kg
Pressure	$1.346528 \text{ kg/cm}^2$
	19.15207 PSI

Figure 35 shows the mechanical drawings for this package. The dimensions are in millimeters.

Figure 35 PG-FCLBGA-277 12 mm x 12 mm Package Outline

## 9 Product Ordering Information

**Table 66** provides the product ordering information.

**Table 66 Product and Package Naming**

Marketing Part Number	Ordering Part Number	Package	Device Number <sup>1)</sup>	Device Revision Number <sup>2)</sup>	PHY Identifier <sup>3)</sup>
MxL86252I	MXL86252I-ABE-R	PG-FCLBGA-277	0x12	0x4	0x5524

1) LDN field in CL22 and CL45 registers.

2) LDRN field in CL22 and CL45 registers.

3) PHY Identifier 2 register 16-bit value.

*Note: For more information about part numbers, as well as the most up-to-date information and additional information on environmental rating, go to <https://www.maxlinear.com/support/product-change-notification>.*

## Terminology

### A

ADS	Auto-Downspeed
AFE	Analog Front End
ANEG	Auto-Negotiation
ANSI	American National Standards Institute
ASP	Analog Signal Processing

### B

BW	Bandwidth
----	-----------

### C

Cat 5	Category 5 Cabling
CDB	Clock Distribution Block
CDR	Clock and Data Recovery
CML	Current Mode Logic

### D

DSP	Digital Signal Processing
DWRR	Deficit Weighted Round Robin

### E

EEE	Energy-Efficient Ethernet
EEPROM	Electrically Erasable Programmable ROM
EMI	Electromagnetic Interference
ESD	Electrostatic Discharge

### F

FCA	Flash Configuration Area
FCS	Frame Check Sequence
FLP	Fast Link Pulse

### G

GMII	Gigabit Media-Independent Interface
GPIO	General Purpose Input/Output

### H

HBM	Human Body Model
-----	------------------

### I

I <sup>2</sup> C	Internally Integrated Circuit Interface (also I2C)
IC	Integrated Circuit
IEEE	Institute of Electrical and Electronics Engineers

### J

JTAG	Joined Test Action Group
------	--------------------------

### L

LAG	Link Aggregation Group
-----	------------------------

LAN	Local Area Network
LED	Light Emitting Diode
LJPLL	Low Jitter Phase-Locked Loop
LPI	Low Power Idle
LSB	Least Significant Bit
<b>M</b>	
MAC	Media Access Controller
MDI	Media-Dependent Interface
MDIO	Management Data Input/Output
MDIX	Media-Dependent Interface Crossover
MMD	MDIO Manageable Device
MSB	Most Significant Bit
<b>N</b>	
NLP	Normal Link Pulse
<b>O</b>	
OSI	Open Systems Interconnection
OUI	Organizationally Unique Identifier
<b>P</b>	
PCB	Printed Circuit Board
PCS	Physical Coding Sublayer
PD	Power Down
PFC	Priority Flow Control
PHY	Physical Layer (device)
PLL	Phase-Locked Loop
PMA	Physical Media Attachment
PPS	Pulse Per Second
PTP	Precision Time Protocol
PTS	Precision Time Stamping
<b>Q</b>	
QSPI	Quad Serial Peripheral Interface
<b>R</b>	
Rx	Receive
<b>S</b>	
SerDes	Serializer-Deserializer
SFP	Small Form-Factor Pluggable
SMD	Surface Mounted Device
SoC	System on Chip
SP	Strict Priority
STA	Station Management Entity (MAC SoC)
SVN	Security Version Number

**T**

TLE	Transformerless Ethernet
TPG	Test Packet Generator
TPI	Twisted Pair Interface
Tx	Transmit

**U**

USXGMII	Universal Serial Multi(x) Gigabit Media Independent Interface
---------	---

**W**

WoL	Wake-on-LAN
WRED	Weighted Random Early Detection
WSP	Web-Smart Processor

**X**

XO	Crystal Oscillator
----	--------------------
