Preface

This Data Sheet describes the features and system architecture of the Ethernet PHY MxL86289I, which is an 8-Port 2.5 Gigabit Ethernet PHY. In addition, the MxL86289I supports the industrial temperature range.

Document Conventions

In the interest of brevity, this document uses short names to represent full product names.

Organization of this Document

- **Chapter 1, Product Overview**
This chapter provides an overview of the MxL86289I.
- **Chapter 2, External Signals**
This chapter provides a pinout of the MxL86289I device package.
- **Chapter 3, Functional Description**
This chapter provides the functional description for the MxL86289I.
- **Chapter 4, MDIO and MMD Register Interface Description**
This chapter describes the MDIO and MMD registers available to support the MxL86289I feature set.
- **Chapter 5, MDIO Registers Detailed Description**
This chapter describes the fields and reset values of the MDIO registers.
- **Chapter 6, MMD Registers Detailed Description**
This chapter describes the fields and reset values of the MMD registers.
- **Chapter 7, Electrical Characteristics**
This chapter provides the electrical characteristics for the MxL86289I.
- **Chapter 8, Package Outline**
This chapter provides a package outline for the MxL86289I.
- **Chapter 9, Product Ordering Information**
This chapter provides the product ordering details for the MxL86289I.
- **Standards References**

1 Product Overview

The MxL86289I device is a low power multi-port Ethernet PHY transceiver integrated circuit with two 10G Ethernet SerDes interfaces. The MxL86289I has eight integrated Ethernet BASE-T PHYs which support four data rates: 2500, 1000, 100, and 10 Mbps.

On the Ethernet Twisted Pair Interface (TPI), the MxL86289I is compliant with the standards from IEEE 802.3 referenced in [2]:

- 2.5GBASE-T (IEEE 802.3 Clause 126, NBASE-T)
- 1000BASE-T (IEEE 802.3 Clause 40)
- 100BASE-TX (IEEE 802.3 Clause 25)
- 10BASE-Te (IEEE 802.3 Clause 14)

This interface supports the Energy-Efficient Ethernet (EEE) feature to reduce idle mode power consumption. Power saving at the system level is also possible with the wake-on-LAN feature. A low-EMI line driver with integrated termination facilitates the PCB design.

With reference to the Open System Interconnection (OSI) model, the MxL86289I implements eight layer 1 physical media access devices, and each is connected to a layer 2 MAC using a SerDes data interface, and an MDIO management interface.

The MxL86289I provides two Ethernet SerDes data interfaces to connect to a MAC processor with multi-port (4 x 2.5G) USXGMII interface using an MDIO slave interface for management.

The MxL86289I supports the Precision Time Protocol (PTP) and Synchronous Ethernet (SyncE).

The MxL86289I supports a standard MDIO management interface as defined in IEEE 802.3 Clause 22 and Clause 45 [2]. The MDIO serial interface is operable with a clock running up to 25 MHz. It allows a management entity (the external chip implementing the MAC) to access standard MDIO/MMD registers to control the MxL86289I's behavior, or to read the link status. The MxL86289I is also configurable via pin strapping.

The MxL86289I is capable of driving up to 16 LEDs (two per BASE-T port). Each LED is independently programmable to indicate the link speed and traffic activities. Several indication schemes are selectable.

External supplies of 0.85 V, 1.2 V, 1.8 V, and 3.3 V are required to power the MxL86289I device.

The MxL86289I uses a ball grid array package (type BGA 16 x16 matrix, size 13 mm x 13 mm).

1.1 Features

This section provides an overview of the features supported by the MxL86289I.

Communication Interfaces

- The eight Ethernet BASE-T interfaces support:
 - Ethernet modes and standards
2.5GBASE-T (IEEE 802.3, NBASE-T), 1000BASE-T (IEEE 802.3), 100BASE-TX (IEEE 802.3), and 10BASE-T_e (IEEE 802.3)
 - Ethernet twisted pair copper cable of category Cat5 or higher
 - Low EMI voltage mode line driver with integrated termination resistors
 - Transformerless Ethernet for backplane applications
 - Auto-Negotiation (ANEG) with extended next page support
 - Auto-MDIX and polarity correction
 - Auto-Downspeed (ADS)
 - 100BASE-TX EEE, 1000BASE-T EEE, 2.5GBASE-T EEE, and power down mode
 - Cable diagnostics: cable open/short detection and cable length estimation
 - Wake-on-LAN (WoL)
 - Precision Time Stamping (PTS), implementing standard IEEE 1588v2
 - Jumbo frames of up to 10 kB
- Two Ethernet SerDes interfaces, where each interface supports:
 - 10G-USXGMII
 - The PHY complies with all of the required features specified in the Cisco USXGMII Multiport Copper PHY Specification [\[7\]](#) and Cisco USXGMII Single-port Copper PHY Specification [\[8\]](#)
 - Back channel equalization, auto-negotiation, Forward Error Correction (FEC)
 - Clock and Data Recovery (CDR), no clock forwarding required
 - Clause 37 auto-negotiation
 - Packet Control Header (PCH) over Preamble
- The management interface supports the communication between the Station Manager (STA, per IEEE 802.3) and the MxL86289I using:
 - A Management Data Input/Output (MDIO) slave interface providing access to the standard registers in the MMD
 - An MDIO interface clock of up to 25 MHz
 - 3 MDIO message frame types as described in IEEE 802.3: Clause 22, Clause 22 Extended, and Clause 45 [\[2\]](#)
- The Quad SPI master interface connecting to serial external Quad-SPI flash memory supports:
 - Programmable interface clock: maximum 101 MHz
 - Internal firmware code access from external Quad-SPI flash memory
 - Write access to the Quad-SPI flash memory
 - Different Quad-SPI flash memory sizes up to 512 MB
 - Secure firmware upgrade of the flash memory
- One instance of the I²C master interface controlling external devices supports these speed modes:
 - Standard mode (<100 Kbps)
 - Fast mode (<400 Kbps)
 - Fast mode plus (<1000 Kbps)
 - High speed mode (<3.4 Mbps)
- The JTAG interface supports:
 - Boundary scan
 - Test and debug interface
 - Shared pins with GPIO functions
- The LED interface supports:
 - Programmable LED

- Up to two LEDs per BASE-T port
- Single and dual color LEDs
- Connection of LED to ground or 3.3 V
- Several LED indication schemes (link/activity, duplex/collision, and link speed)
- Configuration of LED indication via MDIO registers
- Control of LED brightness via software driver API
- Alternative configuration of LED pins as GPIO for custom indication
- Supports two external interrupts:
 - Configurable as output to an external controller
 - Configurable as input from external device(s)
 - Configurable edge, level, and polarity

Flash and Flashless Mode

- In flash mode, an external QSPI memory device is required to store the firmware
- In flashless mode, the firmware is downloaded from a host MAC SoC via the MDIO interface:
 - Broadcast firmware download support
 - Secure firmware download

Clocking, Timing, and Time Stamping Features

- The input reference clock options are:
 - 25 MHz crystal operation
 - 25 MHz direct from an external oscillator
 - An external CML/LVPECL reference clock operating at 50 MHz or 156.25 MHz
- SyncE, implementing standard ITU-T G.8262/Y.1362
- PTP, according to standard IEEE 1588v2
- Four general purpose clock pins GPC0, GPC1, GPC2, and GPC3 shared with GPIO for several usage options, configurable by API:
 - To input or output the Synchronous Ethernet reference clock SyncE: 2.048 MHz, 1.544 MHz
 - To input or output the precise time stamping signals (PTP)
 - To output the pulse per second signal (PPS)

1588 Time Stamp

- Ethernet packet time stamping as IEEE 1588 (v1 and v2) and IEEE 802.1AS-REV
- PTP over Ethernet and PTP over UDP over IPv4/IPv6
- It is possible to adjust time and frequency of the system reference time.
- Auxiliary time stamp snapshot for the time synchronization with other chips via the GPIO type signal
- 1 pulse per second (PPS) output programmable for start, stop, pulse width, and interval
- 1-step time stamping in Tx direction
- 2-step time stamp (16-entries in FIFO per Ethernet port) in Tx direction

Synchronous Ethernet (SyncE)

- Synchronous Ethernet according to ITU-T G.8262/Y.1362.
- Supports EEC-1 (2.048 MHz), EEC-2 (1.544 MHz), and 8 kHz reference clock input.
- Supports regeneration of these reference clocks as output.

Preemption

- Recognize preemption packet types defined in IEEE 802.3br.
- Forwarding of preemption packets
- PCH support of preemption packets

Other Features

- Temperature Sensor (warning, interrupt, reset and auto-downspeed)

Power Supply

- 3.3 V, 1.8 V, 1.2 V, and 0.85 V external power sources

1.2 Block Diagram

Figure 1 shows the block diagram of the MxL86289I. The main interfaces are:

- Data interface to SoC/MAC processor, using USXGMII
- Slave control interface driven by a SoC/MAC processor, using MDIO slave
- Master control interface using I²C master
- Interrupt signal MDINT allowing the MxL86289I to notify the SoC/MAC processor about a change of status
- LED control
- Twisted pair interfaces (TPI)
- Master Quad Serial Peripheral Interface (QSPI) interface

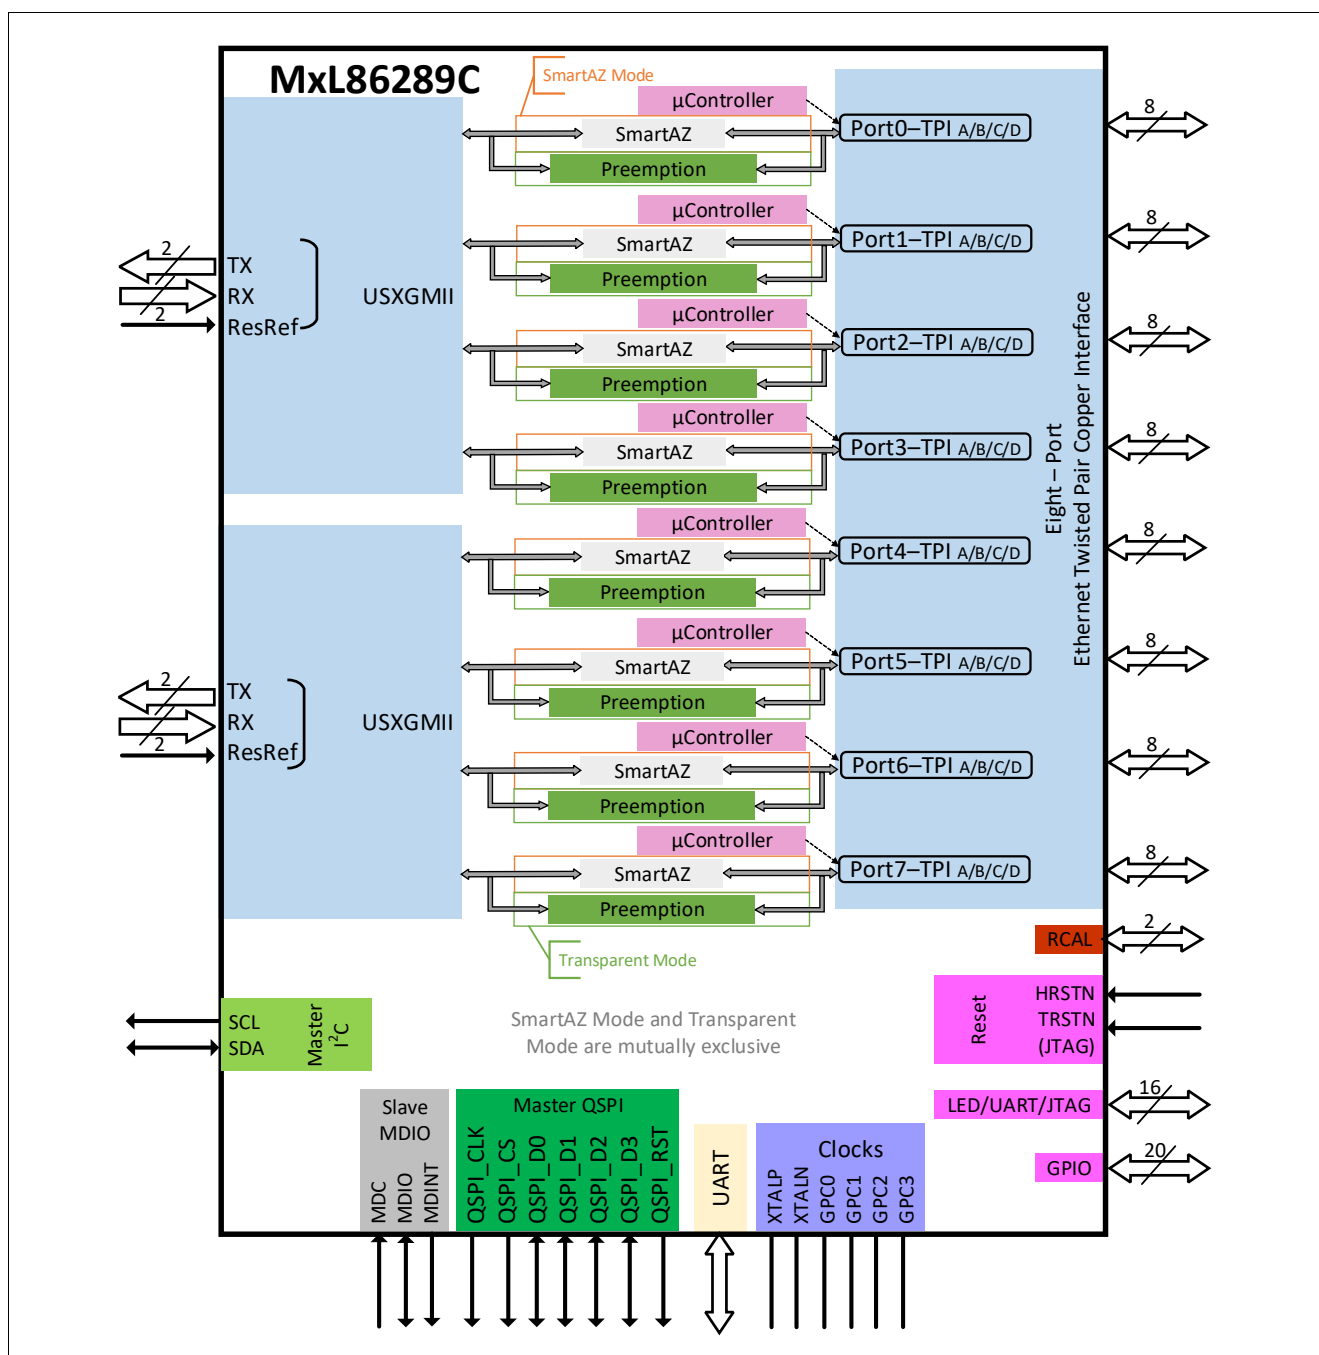

Figure 1 MxL86289I Block Diagram

2 External Signals

This chapter describes the signal mapping to the package.

2.1 Logic Symbol

Figure 2 gives an overview of the device's external interfaces.

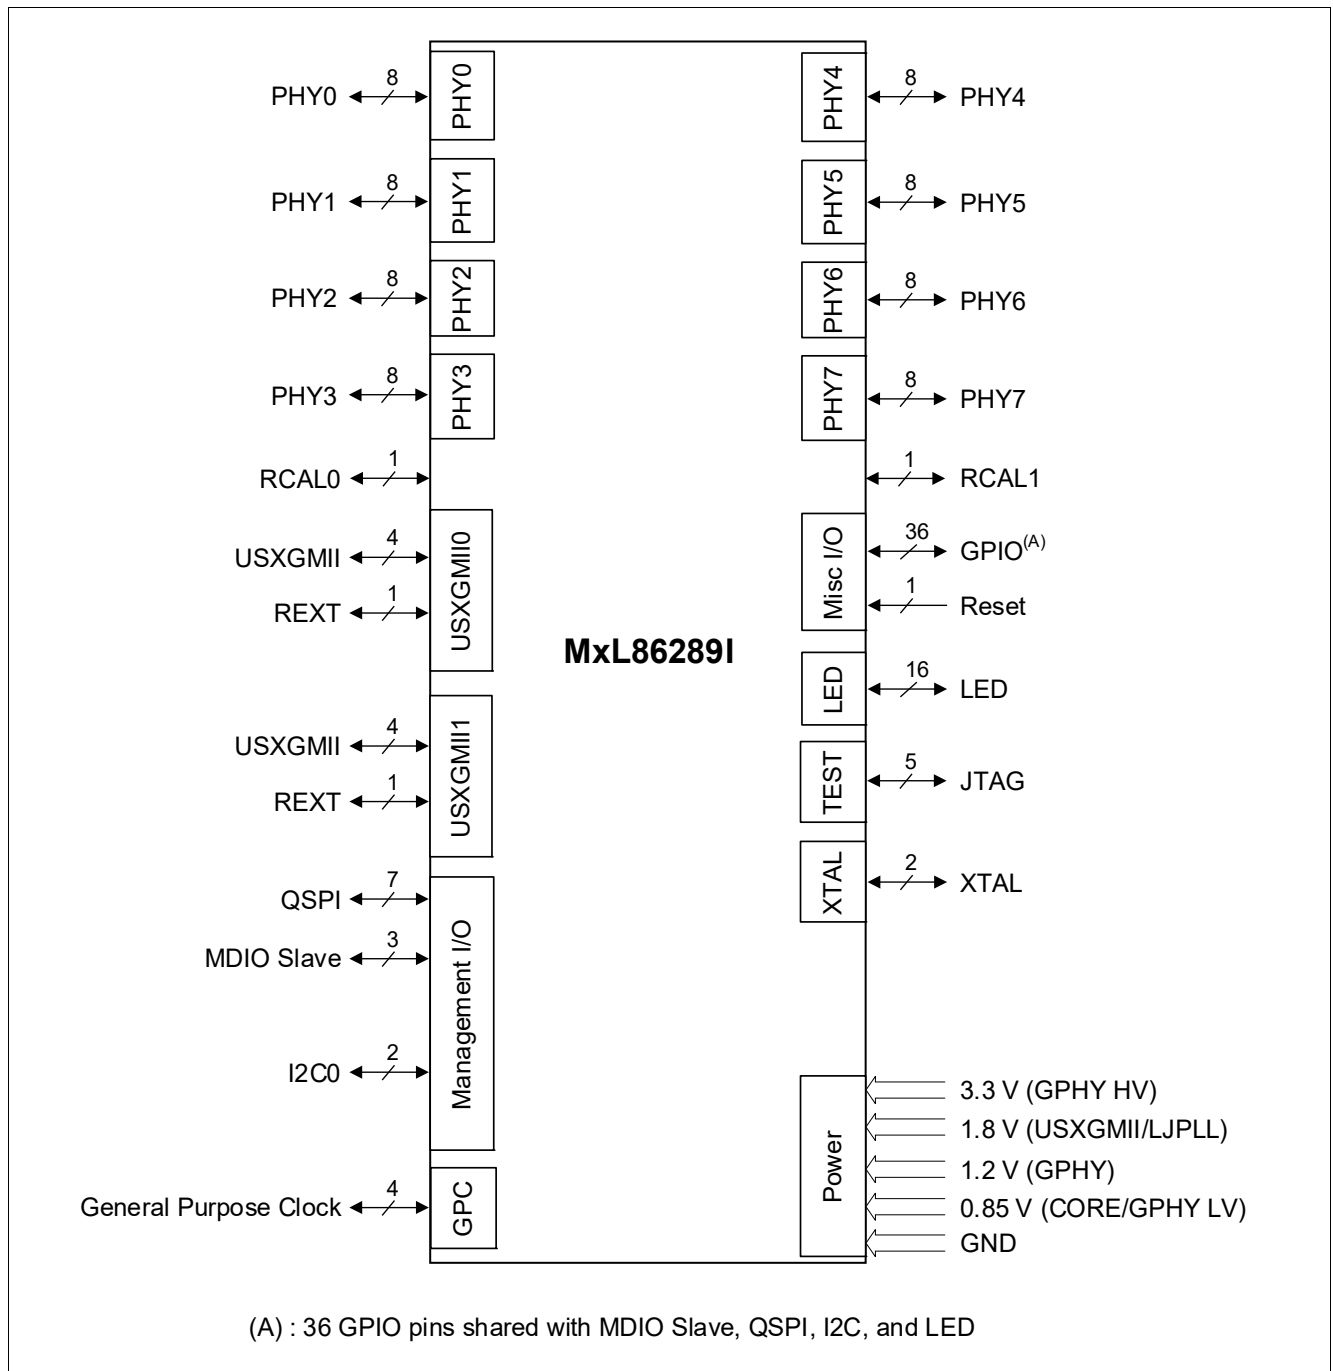

Figure 2 MxL86289I External Signal Overview

2.2 External Signal Description

This section provides the ball diagram, abbreviations for pin types and buffer types, and the table of input and output signals.

2.2.1 Ball Diagram

Figure 3 shows the ball diagram. **Table 1** lists the ball diagram color codes.

Figure 3 Ball Diagram for PG-FCLBGA-256 (Top View)

2.2.2 Abbreviations

Table 2 and **Table 3** summarize the abbreviations used in the signal tables.

Table 2 Abbreviations for Pin Type

Abbreviations	Description
I	Input-only, digital levels
O	Output-only, digital levels
I/O	Bidirectional input/output signal, digital levels
Prg	Bidirectional pin, programmable to operate either as input or output, digital levels
AI	Input-only, analog levels
AO	Output-only, analog levels
AI/AO	Bidirectional, analog levels
PWR	Power
GND	Ground

Table 3 Abbreviations for Buffer Type

Abbreviations	Description
A	Analog characteristics, see the AC/DC specification for more information.
Prg	Programmable (open-drain/push-pull, pull-up/pull-down characteristic are programmable)
PU	Pull up (internal, weak)

2.2.3 Input/Output Signals

Table 4 to Table 15 provide a detailed description of all the pins.

2.2.3.1 Ethernet Twisted Pair Interface

Unused TPI signals must be unconnected.

Table 4 Ethernet Twisted Pair Interface Signals

Ball No.	Name	Pin Type	Buffer Type	Function
Ethernet Port Twisted Pair Interface				
A15	TPAP_0	AI/AO	A	Port 0 Transmit/Receive Positive/Negative
B15	TPAN_0	AI/AO	A	
A14	TPBP_0	AI/AO	A

R8	TPAP_6	AI/AO	A	Port 6 Transmit/Receive Positive/Negative
T8	TPAN_6	AI/AO	A	
R9	TPBP_6	AI/AO	A	
T9	TPBN_6	AI/AO	A	
R10	TPCP_6	AI/AO	A	
T10	TPCN_6	AI/AO	A	
R11	TPDP_6	AI/AO	A	
T11	TPDN_6	AI/AO	A	
R12	TPAP_7	AI/AO	A	Port 7 Transmit/Receive Positive/Negative
T12	TPAN_7	AI/AO	A	
R13	TPBP_7	AI/AO	A	
T13	TPBN_7	AI/AO	A	
R14	TPCP_7	AI/AO	A	
T14	TPCN_7	AI/AO	A	
R15	TPDP_7	AI/AO	A	
T15	TPDN_7	AI/AO	A	
Ethernet Port Test Point				
D6	RCAL_0	AI/AO	A	Test Point for GPHY Ethernet Ports 0 to 3 Test point, do not connect.
N6	RCAL_1	AI/AO	A	Test Point for GPHY Ethernet Ports 4 to 7 Test point, do not connect.

2.2.3.2 USXGMII Interface

Table 5 USXGMII Interface Signals

Ball No.	Name	Pin Type	Buffer Type	Function
D15	URXP_0	AI	A	Differential USXGMII 0 Data Input Pair These are the negative and positive signals of the differential input pair of the USXGMII SerDes interface. Due to the integrated CDR, no external transmission peer source-synchronous clock is required for USXGMII. These pins must be AC-coupled.
C16	URXM_0	AI	A	
E16	UTXP_0	AO	A	Differential USXGMII 0 Data Output Pair These are the negative and positive signals of the differential output pair of the USXGMII SerDes interface. Due to the integrated CDR, no external transmission peer source-synchronous clock is required for USXGMII. These pins must be AC-coupled.
E15	UTXM_0	AO	A	
B16	URESREF_0	AI/AO	A	External USXGMII Tuning Resistor 0 Attach a 200 Ω ($\pm 1\%$) resistor-to-ground on the board.
N15	URXP_1	AI	A	Differential USXGMII 1 Data Input Pair These are the negative and positive signals of the differential input pair of the USXGMII SerDes interface. Due to the integrated CDR, no external transmission peer source-synchronous clock is required for USXGMII. These pins must be AC-coupled.
P16	URXM_1	AI	A	
M16	UTXP_1	AO	A	Differential USXGMII 1 Data Output Pair These are the negative and positive signals of the differential output pair of the USXGMII SerDes interface. Due to the integrated CDR, no external transmission peer source-synchronous clock is required for USXGMII. These pins must be AC-coupled.
M15	UTXM_1	AO	A	
R16	URESREF_1	AI/AO	A	External USXGMII Tuning Resistor 1 Attach a 200 Ω ($\pm 1\%$) resistor-to-ground on the board.

2.2.3.3 MDIO Interface

Table 6 MDIO Management Interface Signals

Ball No.	Name	Pin Type	Buffer Type	Function
MDIO Slave Interface				
L14	MDINT	O		MDIO Interrupt from Any GPHY The interrupt interrupts an external block such as a higher-level management entity or a device controller of an SoC, on detection of certain events and states inside the GPHY device. Voltage Domain: 1.8 V / 3.3 V
	GPIO4	Prg	Prg	General Purpose IO 4 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 1.8 V / 3.3 V
K16	MDC_S	I		MDIO Slave Clock The external controller provides the serial clock of up to 25 MHz on this input. Voltage Domain: 1.8 V / 3.3 V
	GPIO5	Prg	Prg	General Purpose IO 5 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 1.8 V / 3.3 V
K15	MDIO_S	I/O		MDIO Slave Data Input/Output The external controller uses this signal to address internal registers and to transfer data to and from the internal registers. Voltage Domain: 1.8 V / 3.3 V
	GPIO6	Prg	Prg	General Purpose IO 6 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 1.8 V / 3.3 V

2.2.3.4 QSPI Interface

Table 7 QSPI Management Interface Signals

Ball No.	Name	Pin Type	Buffer Type	Function
K14	QSPI_D0	I/O		QSPI Data 0 QSPI interface data 0 Voltage Domain: 3.3 V
	GPIO9	Prg	Prg	General Purpose IO 9 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
J14	QSPI_D1	I/O		QSPI Data 1 QSPI interface data 1 Voltage Domain: 3.3 V
	GPIO10	Prg	Prg	General Purpose IO 10 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
J15	QSPI_D2	I/O		QSPI Data 2 QSPI interface data 2 Voltage Domain: 3.3 V
	GPIO11	Prg	Prg	General Purpose IO 11 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
H14	QSPI_D3	I/O		QSPI Data 3 QSPI interface data 3 Voltage Domain: 3.3 V
	GPIO12	Prg	Prg	General Purpose IO 12 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
J16	QSPI_CLK	O		QSPI Clock QSPI interface clock output Voltage Domain: 3.3 V
	GPIO13	Prg	Prg	General Purpose IO 13 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V

Table 7 **QSPI Management Interface Signals** (cont'd)

Ball No.	Name	Pin Type	Buffer Type	Function
H16	QSPI_CS	O		QSPI Chip Select QSPI interface chip select Voltage Domain: 3.3 V
	GPIO14	Prg	Prg	General Purpose IO 14 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
H15	QSPI_RST	O		QSPI Reset QSPI Reset Voltage Domain: 3.3 V
	GPIO15	Prg	Prg	General Purpose IO 15 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V

2.2.3.5 I²C Interface

Table 8 I²C Management Interface Signals

Ball No.	Name	Pin Type	Buffer Type	Function
L12	I2C_SCL_0	O		I²C 0 Clock Output I ² C 0 interface clock output Voltage Domain: 3.3 V
	GPIO16	Prg	Prg	General Purpose IO 16 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
K13	I2C_SDA_0	I/O		I²C 0 Data I ² C 0 interface data Voltage Domain: 3.3 V
	GPIO17	Prg	Prg	General Purpose IO 17 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V

2.2.3.6 Reset Interface

Table 9 Reset Signals

Ball No.	Name	Pin Type	Buffer Type	Function
G3	HRSTN	I	PU	Hardware Reset Asynchronous active low device reset Voltage Domain: 3.3 V

2.2.3.7 LED/UART/JTAG Interface

Table 10 LED and Debug Interface Signals

Ball No.	Name	Pin Type	Buffer Type	Function
LED Signals				
E1	PHYLED1_0	I/O		GPHY LED1 for Port 0 LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO20	Prg	Prg	General Purpose IO 20 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	FW_UTXD	O		Firmware UART Data Output Firmware UART interface data output Voltage Domain: 3.3 V
F3	PHYLED2_0	I/O		GPHY LED2 for Port 0 LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO21	Prg	Prg	General Purpose IO 21 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	FW_URXD	I		Firmware UART Data Input Firmware UART interface data input Voltage Domain: 3.3 V
F1	PHYLED1_1	I/O		GPHY LED1 for Port 1 LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO23	Prg	Prg	General Purpose IO 23 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	FW_UTXD	O		Firmware UART Data Output Firmware UART interface data output Voltage Domain: 3.3 V
F2	PHYLED2_1	I/O		GPHY LED2 for Port 1 LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO24	Prg	Prg	General Purpose IO 24 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V

Table 10 LED and Debug Interface Signals (cont'd)

Ball No.	Name	Pin Type	Buffer Type	Function
G1	PHYLED1_2	I/O		GPHY LED1 for Port 2 LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO26	Prg	Prg	General Purpose IO 26 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	TDI	I		JTAG Serial Test Data Input Voltage Domain: 3.3 V <i>Note: No external pull-up required.</i>
	FW_UTXD	O		Firmware UART Data Output Firmware UART interface data output Voltage Domain: 3.3 V
G2	PHYLED2_2	I/O		GPHY LED2 for Port 2 LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO27	Prg	Prg	General Purpose IO 27 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	TMS	I		JTAG Test Mode Select Voltage Domain: 3.3 V <i>Note: No external pull-up required.</i>
H1	PHYLED1_3	I/O		GPHY LED1 for Port 3 LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO29	Prg	Prg	General Purpose IO 29 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	TCK	I		JTAG Test Clock The signals TDI, TDO and TMS are synchronous subject to this JTAG test clock. Voltage Domain: 3.3 V
	FW_UTXD	O		Firmware UART Data Output Firmware UART interface data output Voltage Domain: 3.3 V

Table 10 LED and Debug Interface Signals (cont'd)

Ball No.	Name	Pin Type	Buffer Type	Function
H2	PHYLED2_3	I/O		GPHY LED2 for Port 3 LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO30	Prg	Prg	General Purpose IO 30 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	TDO	I/O		JTAG Serial Test Data Output JTAG test data output. Voltage Domain: 3.3 V <i>Note: No external pull-up required.</i>
J1	PHYLED1_4	I/O		GPHY LED1 for Port 4 LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO32	Prg	Prg	General Purpose IO 32 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	FW_UTXD	O		Firmware UART Data Output Firmware UART interface data output Voltage Domain: 3.3 V
J2	PHYLED2_4	I/O		GPHY LED2 for Port 4 LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO33	Prg	Prg	General Purpose IO 33 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
K1	PHYLED1_5	I/O		GPHY LED1 for Port 5 LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO35	Prg	Prg	General Purpose IO 35 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	FW_UTXD	O		Firmware UART Data Output Firmware UART interface data output Voltage Domain: 3.3 V

Table 10 LED and Debug Interface Signals (cont'd)

Ball No.	Name	Pin Type	Buffer Type	Function
K2	PHYLED2_5	I/O		GPHY LED2 for Port 5 LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO36	Prg	Prg	General Purpose IO 36 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
L1	PHYLED1_6	I/O		GPHY LED1 for Port 6 LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO38	Prg	Prg	General Purpose IO 38 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	FW_UTXD	O		Firmware UART Data Output Firmware UART interface data output Voltage Domain: 3.3 V
L2	PHYLED2_6	I/O		GPHY LED2 for Port 6 LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO39	Prg	Prg	General Purpose IO 39 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
M1	PHYLED1_7	I/O		GPHY LED1 for Port 7 LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO41	Prg	Prg	General Purpose IO 41 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	FW_UTXD	O		Firmware UART Data Output Firmware UART interface data output Voltage Domain: 3.3 V

Table 10 LED and Debug Interface Signals (cont'd)

Ball No.	Name	Pin Type	Buffer Type	Function
L3	PHYLED2_7	I/O		GPHY LED2 for Port 7 LED control output, drives single-color or dual color LEDs. Voltage Domain: 3.3 V
	GPIO42	Prg	Prg	General Purpose IO 42 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
M2	TRSTN	I		JTAG Test Enabling At logic HIGH: the GPIO pins are used as JTAG interface (TCK, TDI, TDO, and TMS) At logic LOW: the GPIO pins their normal application mode Voltage Domain: 3.3 V

2.2.3.8 Miscellaneous Signals

Table 11 Miscellaneous Signals

Ball No.	Name	Pin Type	Buffer Type	Function
Reset and Clocking				
G16	XTAL1	AI	A	Crystal: Oscillator Input A crystal must be connected between XTAL1 and XTAL2. Additional load capacitances must tie both pins to GND.
	CLK	AI	A	Crystal Oscillator: Clock Input A clock of 25, 50, or 156.25 MHz must be connected to CLK. See Section 7.7.2 for the clock details. XTAL2 must not be connected.
G15	XTAL2	AO	A	Crystal: Oscillator Output A crystal must be connected between XTAL1 and XTAL2. Additional load capacitances must tie both pins to GND.
F13	GPC0	Prg		General Purpose Clock 0 General purpose clock for SyncE or external devices. Either input or output mode. Voltage Domain: 3.3 V
	GPIO44	Prg	Prg	General Purpose IO 44 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
G13	GPC1	Prg		General Purpose Clock 1 General purpose clock for SyncE or external devices. Either input or output mode. Voltage Domain: 3.3 V
	GPIO45	Prg	Prg	General Purpose IO 45 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
F14	GPC2	Prg		General Purpose Clock 2 General purpose clock for SyncE or external devices. Either input or output mode. Voltage Domain: 3.3 V
	GPIO46	Prg	Prg	General Purpose IO 46 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V

Table 11 **Miscellaneous Signals** (cont'd)

Ball No.	Name	Pin Type	Buffer Type	Function
J13	GPC3	Prg		General Purpose Clock 3 General purpose clock for SyncE or external devices. Either input or output mode. Voltage Domain: 3.3 V
	GPIO47	Prg	Prg	General Purpose IO 47 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
L15	GPIO0	Prg	Prg	General Purpose IO 0 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 1.8 V / 3.3 V
	EXTINT0	Prg	Prg	External Interrupt 0 Voltage Domain: 1.8 V / 3.3 V
H3	GPIO1	Prg	Prg	General Purpose IO 1 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
	EXTINT1	Prg	Prg	External Interrupt 1 Voltage Domain: 3.3 V
J3	GPIO2	Prg	Prg	General Purpose IO 2 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V
K3	GPIO3	Prg	Prg	General Purpose IO 3 Either input or output mode. The output characteristic is either open drain or push-pull. Voltage Domain: 3.3 V

2.2.3.9 Power Supply for GPHY

Table 12 Power Supply Pins for GPHY

Ball No.	Name	Pin Type	Buffer Type	Function
C11	VDDA3V3_0	PWR		GPHY 0, 3.3 V Voltage Domain Supply This is the PHY 0 AFE 3.3 V supply.
C9	VDDA3V3_1	PWR		GPHY 1, 3.3 V Voltage Domain Supply This is the PHY 1 AFE 3.3 V supply.
C7	VDDA3V3_2	PWR		GPHY 2, 3.3 V Voltage Domain Supply This is the PHY 2 AFE 3.3 V supply.
C5	VDDA3V3_3	PWR		GPHY 3, 3.3 V Voltage Domain Supply This is the PHY 3 AFE 3.3 V supply.
P5	VDDA3V3_4	PWR		GPHY 4, 3.3 V Voltage Domain Supply This is the PHY 4 AFE 3.3 V supply.
P7	VDDA3V3_5	PWR		GPHY 5, 3.3 V Voltage Domain Supply This is the PHY 5 AFE 3.3 V supply.
P9	VDDA3V3_6	PWR		GPHY 6, 3.3 V Voltage Domain Supply This is the PHY 6 AFE 3.3 V supply.
P11	VDDA3V3_7	PWR		GPHY 7, 3.3 V Voltage Domain Supply This is the PHY 7 AFE 3.3 V supply.
D7, D8	VDDA1V8_0	PWR		GPHY 0, 1, 2, 3, 1.8 V Voltage Domain Supply This is the 1.8 V supply for PHY 0 to PHY 3 AFE voltage domain. It supplies mixed signal blocks in the AFE.

3 Functional Description

3.1 Power Supply, Clock, and Reset

This section provides the information required to power up the MxL86289I.

3.1.1 Power Supply

These four power supply rails are required: 3.3 V, 0.85 V, 1.8 V, and 1.2 V. [Section 7.7.1](#) contains the power-up sequence.

3.1.2 Clock

An internal PLL circuit generates the required internal clocks, based on an external reference clock.

The available options are:

- An external 25 MHz crystal connected to the MxL86289I. [Section 7.7.9](#) documents the required crystal specification.
- 25 MHz direct from an external oscillator
- An external CML/LVPECL reference clock operating at 50 MHz
- An external LVPECL reference clock operating at 156.25 MHz

3.1.3 Reset Generation

The external hardware reset input (HRSTN pin) resets all the hardware modules including the pin strapping information during boot:

- Driving the HRSTN pin low causes an asynchronous reset of the MxL86289I system.
- Releasing the HRSTN pin high triggers the power-on sequence.

The HRSTN pin is internally connected to a weak internal pull-up resistor.

3.1.4 Power-On Sequence

The MxL86289I powers on when the power is applied and the HRSTN pin is high. See [Figure 18](#).

The steps executed at power on are:

1. Lock the internal PLL.
2. Read the pin strap information, see [Section 3.1.5](#) for more information.
3. Boot the microprocessor from the internal ROM.
4. In flashless mode, wait for the firmware to download into on-chip memory.
5. Authenticate the firmware image in the flash memory device or on-chip memory.
6. Auto-negotiate the link speeds for the Ethernet TPI and USXGMII interfaces.
7. Train and link up each interface in accordance with the IEEE 802.3 [\[2\]](#) standards.

3.1.5 Configuration by Pin Strapping

The MxL86289I is configurable by means of pin strapping on a number of the GPIO pins. The pin strapping configurations are captured during the chip power-on sequence until the reset initialization is complete.

The pin strap values are set to logical high or low by connecting the corresponding pin via an external 1 kΩ resistor to either ground or the pin supply voltage.

Table 16 and **Table 17** describe the pin strap mapping.

Table 16 Pin Names Used for Pin Strapping

Ball Name	Ball Number	Configuration Item Description
GPC1	G13	PS_PHY_MADDR(4)
GPC2	F14	PS_PHY_MADDR(3)
GPC3	J13	PS_CLK_SEL
GPIO1	H3	PS_CLK_SEL1
GPIO2	J3	PS_RJ45_TAB
MDINT	L14	PS_MDINT_POLARITY
GPIO3	K3	PS_MDIO_VOLTAGE
GPC0	F13	PS_SUPER_ISOLATE
QSPI_CS	H16	PS_FLASHLESS

Table 17 Pin Strapping Configuration Description

Pin Strapping Signals	Description
PS_PHY_MADDR(4:3)	MDIO PHY Address Specifies the most significant two bits of the MDIO address. The lowest three bits are hard-coded to 0, 1, 2, 3, 4, 5, 6, and 7 for each BASE-T port of the MxL86289I.
PS_MDINT_POLARITY	MDIO Interrupt Polarity Specifies the polarity of the MDIO interrupt. 0 _B HIGH MDIO interrupt is active high. 1 _B LOW MDIO interrupt is active low.
PS_RJ45_TAB	RJ45 Tab Configuration Specifies the tab-up or tab-down configuration of the RJ45. Each BASE-T port has the same configuration. 1 _B DOWN Tab-down 0 _B UP Tab-up
PS_MDIO_VOLTAGE	MDIO Voltage Specifies whether the maximum voltage level used by the MDIO signals is 3.3 V or 1.8 V. 0 _H LOW MDIO_S, MDC_S, MDINT, and GPIO0 signal pins are supplied with 1.8 V. In this configuration, V _{DDP} must be supplied with 1.8 V. 1 _H NORMAL MDIO_S, MDC_S, MDINT, and GPIO0 signal pins are supplied with 3.3 V. In this configuration, V _{DDP} must be supplied with 3.3 V.

Functional Description

Table 17 Pin Strapping Configuration Description (cont'd)

Pin Strapping Signals	Description
PS_CLK_SEL PS_CLK_SEL1	Input Clock Selection Specifies the input clock frequency used. MSB is PS_CLK_SEL1. LSB is PS_CLK_SEL. 11 _B 25 25 MHz 10 _B 50 50 MHz 01 _B 156 156.25 MHz 00 _B RES Reserved
PS_SUPER_ISOLATE	Super Isolate Specifies whether the PHY is immediately active after a reset or is halted until it is manually activated. 0 _H HALT The PHYs are inactive after reset. 1 _H NORMAL The PHYs are active after reset.
PS_FLASHLESS	Flashless Specifies whether the device operates with or without an external flash memory device. 0 _H FLASHLESS A flash memory device is not attached. 1 _H NORMAL A flash memory device is attached.

Alternative ways to configure the MxL86289I after the boot process are to use the MDIO interface [1] and write into various control registers, as detailed in [Section 3.3](#), or to use the FCA [1].

3.2 MDIO Slave Interface

The SMDIO module and the Ethernet PHY (GPHY) port 0 to 7 are directly attached to the MDIO slave interface as shown in the [Figure 4](#). Each GPHY port supports both IEEE 802.3 clause 22 and clause 45 protocol. It allows direct access to the PHY using the correct MDIO PHY address. The MDIO address used for this access is configurable through pin-strapping, as described in [Section 3.1.5](#).

The SMDIO module provides access to the external flash memory device via the QSPI interface and the internal SRAM. The MxL86289I supports downloading of firmware to the flash memory device or the internal SRAM via the SMDIO module attached to the MDIO bus. In the flash mode, whereby the firmware is downloaded to the external flash memory device, the MDIO address used for this access is the same MDIO address as GPHY port 0 defined by the pin strapping. In the flashless mode, whereby the firmware is downloaded to the internal SRAM, the MDIO address used for this access is $1F_H$. The MxL86289I user guide [\[1\]](#) describing the driver software executed on the external processor must be followed to execute this feature. The SMDIO module supports only IEEE 802.3 clause 22 protocol.

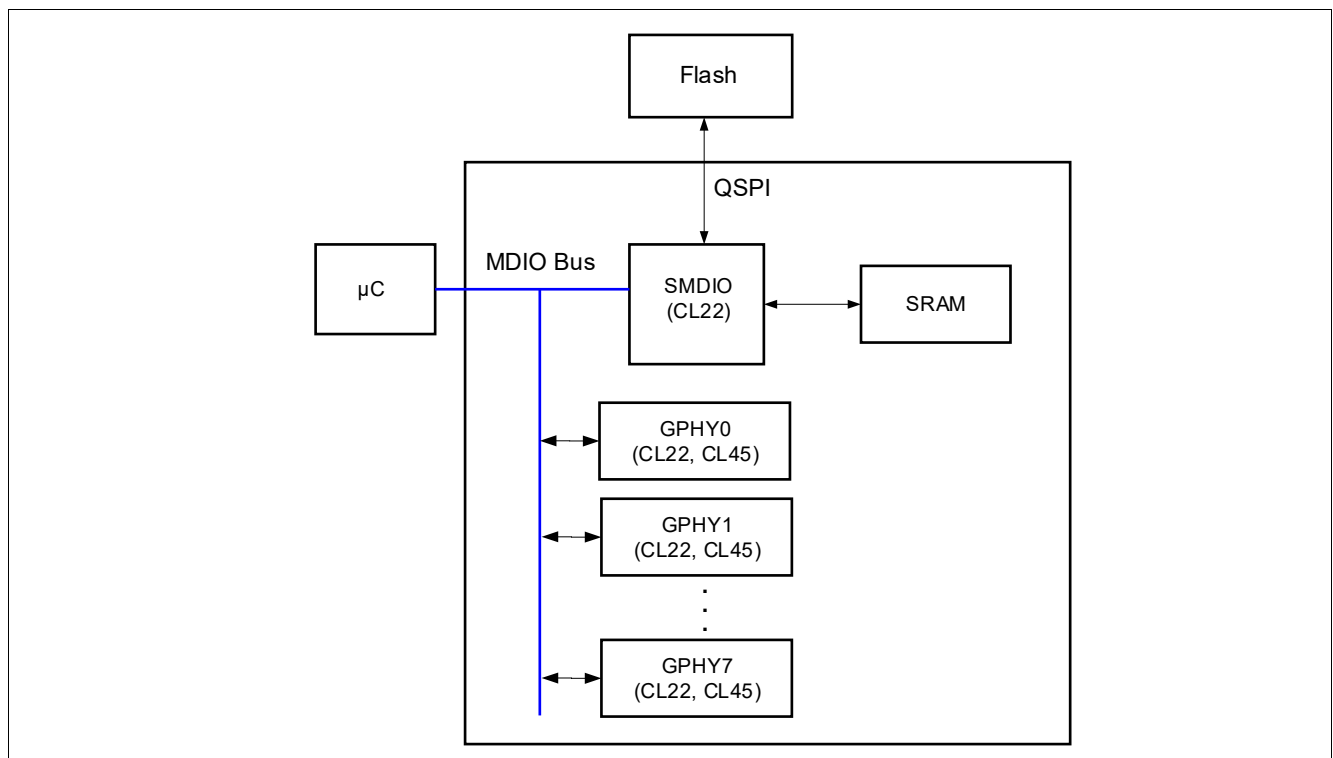

Figure 4 MDIO Slave

When other devices in the system need to be configured through MDIO, they must be connected to the MDIO slave interface and configured such that no addressing conflict arises.

The standard MDIO protocol requires a 32-bit preamble at the beginning of each read or write access. To speed up the data exchange, reduce the preamble down to 1 bit for the second and subsequent accesses.

The standard MDIO protocol uses a clock rate of 2.5 MHz on MDC. To speed up the data exchange, increase the clock applied on MDC_S to the maximum 25 MHz. [Section 7.7.4](#) contains more details on AC characteristics.

3.3 Configuration via MDIO Management Interface

It is possible to connect an external controller's STA to the chip's slave MDIO interface. This allows access to the MDIO and MMD registers standardized in IEEE 802.3, enabling the STA to control the chip configuration and retrieve status information. The MDIO transactions are any of the three types described in IEEE 802.3 Clause 22, Clause 22 Extended, and Clause 45 [2].

Figure 5 and Table 18 show the minimum time required for the MDIO to be available for access.

Figure 5 MDIO Access Timing

Table 18 MDIO Ready Timing

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
MDIO Ready Time with Flash Device Attached	T_{MDIO}	750	—	—	ms	Flash Memory Mode This is the minimum amount of time the MDIO interface is unavailable while the MxL86289I boots and the firmware is downloaded from an external flash device using the QSPI interface.
MDIO Ready Time without Flash Device Attached	T_{MDIO}	50	—	—	ms	Flashless Mode This is the minimum amount of time the MDIO interface requires before a firmware download can be initiated from a host MAC SoC using the MDIO interface. MDIO and MMD register access is only available after the firmware download has completed and successfully authenticated.

3.4 I²C Master Interface

The MxL86289I has one chip-integrated I²C master controller. The Inter-IC (I²C) Bus was developed by Philips Semiconductors (now NXP Semiconductors). This specification is compliant with [\[9\]](#).

The I²C is a simple, bi-directional half-duplex bus with data transfers of up to 100 Kbps in standard mode, up to 400 Kbps in fast mode, up to 1000 Kbps in fast mode plus, and up to 3.4 Mbps in high-speed (hs) mode.

I²C provides a protocol allowing devices to communicate directly with each other via two wires. One line is responsible for the clock synchronization (SCL), the other is responsible for the data transfer (SDA). The number of devices connected to the I²C bus is limited only by a maximum bus capacity of 400 pF. Each device is recognized by a unique address.

The two bi-directional bus lines, a Serial Data (SDA) line and a Serial Clock (SCL) line, are connected to a positive supply voltage via pull-up resistors. The output stages of devices must have an open drain to perform the required wired-AND function. One line is pulled low when one of the open-drain transistors is selected. Otherwise, no signal is asserted to the line. The external pull-up resistors lift the level to HIGH.

The I²C specification defines a master/slave relationship where each device works either as a transmitter or a receiver depending on the device function. This functionality is set in the initialization procedure of each module.

Features

- One I²C controller
- Master-mode supported
- Compatible to the I²C specification version 6.0, April 2014¹⁾
- Data transfer in standard- (0 to 100 kBaud), fast- (0 to 400 kBaud), fast mode plus (0 to 1 Mbps) and high-speed mode (0 to 3.4 Mbps)

1) For deviations of timing values compared to the Philips Semiconductors (now NXP Semiconductors*) specifications, see [Chapter 7 Electrical Characteristics](#).

3.5 Quad Serial Peripheral Interface

A Quad Serial Peripheral Interface (QSPI) is equipped to provide access to external Quad-SPI flash memory devices. The MxL86289I requires an external Quad-SPI flash memory to operate in flash mode. Flashless mode allows the firmware to be downloaded via the slave MDIO. The mode is selectable by pin strapping.

Use of an additional QSPI flash memory device depends upon the device operation mode:

- In flash mode, the firmware for the MxL86289I is stored in an external QSPI flash memory device and transferred over the QSPI interface. In flash mode, an external QSPI flash memory device is required.
- In flashless mode, the firmware for the MxL86289I is stored on a host SoC and transferred over the slave MDIO interface. In flashless mode, an external QPSI flash memory device is not required.

The QSPI supports:

- Up to 101.5625 MHz for single/double data rate
- eXecution In Place (XIP), fully memory mapped access for CPU
- Addressing up to 512 MB range

3.5.1 Supported Flash Memory Devices

Table 19 lists the qualified flash memory devices. However, it is possible for the user to select a device not present in the list after consideration of command compatibility and timing compatibility as listed in **Table 20**. The flash memory device must support 101.5625 MHz single data rate.

Table 19 Supported Flash Memory Devices

Vendor	Model
Macronix	MX25L6433F
Winbond	W25Q64JV-DTR

Table 20 Flash Command and Timing

Instruction	Abbreviation	Command	Command Cycles	Address Cycles	Dummy Cycles	Data Cycles

1) n is the number of bytes

3.6 GPIO Mapping

Other than the GPIO functionality, the GPIO pins are also shared with other alternative functions. The GPIO pins are configurable to alternative functions, which are based on the pinmux settings as shown in [Table 21](#).

Table 21 GPIO Mapping

Pinmux Mode 0 (Default)	Pinmux Mode 1	Pinmux Mode 2	Pinmux Mode 3

3.7 Ethernet PHY Interface

The Ethernet PHY implements the physical layer of the Ethernet standard. It supports Digital Signal Processing (DSP) and Analog Signal Processing (ASP) functions in transmitting data over the twisted pair cable.

3.7.1 Twisted Pair Interface

The Twisted Pair Interface (TPI) of the MxL86289I is fully compliant with IEEE 802.3. The MxL86289I integrates series resistors required to terminate the TPI links with a 100 Ω nominal impedance to facilitate a low-power implementation and reduce PCB costs. As a consequence, it is possible to connect the TPI pins directly via a transformer to the RJ45 connector. Additional external circuitry is required for common-mode termination and rejection as described in [Section 7.8.1](#).

Figure 6 shows a schematic of the TPI circuitry taking these components into account.

Figure 6 Twisted-Pair Interface of MxL86289I Including Transformer and RJ45 Plug

3.7.2 Transformerless Ethernet

Transformerless Ethernet (TLE) is required for backplane applications where the use of a transformer is not always required to fulfill the galvanic decoupling requirements of the isolation specifications. In such applications, removing the transformer reduces both the external bill of material and the space requirements on the PCB.

As the MxL86289I incorporates a voltage-mode line driver, the only stringent requirement is to use AC coupling, which is achievable using simple SMD type series capacitors. The value of the capacitors is selected such that the high-pass characteristics correspond to an equivalent standard transformer based application. The recommended value is $C_{\text{coupling}} = 100 \text{ nF}$. **Figure 7** shows the external circuitry for TLE.

Figure 7 External Circuitry for the Transformerless Ethernet Application

3.7.3 Auto-Negotiation

The MxL86289I supports auto-negotiation (ANEG) as part of the startup procedure to exchange capability information with the link partner. ANEG is enabled at the MxL86289I initialization and its 2.5 Gbps speed capability is advertised. The ANEG procedure is executed according to IEEE 802.3 Clause 28, Clause 40, and IEEE 802.3 Clause 126 [2]. When the link partner does not support ANEG, the MxL86289I determines the link speed configuration using parallel detection as described in Clause 28.

With MDIO commands, it is possible to disable ANEG and change the advertised link rates. The STA is also able to disable ANEG. In this situation, the system configuration must ensure compatibility between link partners to allow link up in a compatible mode.

Attention: STD_CTRL.DPLX only takes effect when the ANEG process is disabled and the GPHY TPI is not operating in loopback mode, that is, bits STD_CTRL.ANEN and STD_CTRL.LB are set to zero. Forced half-duplex mode (STD_CTRL.DPLX = 0b0) is only supported in 10BASE-T and 100BASE-TX speed modes. This field is ignored for higher speeds. This field is also ignored for transparent mode because half-duplex is not supported in this mode.

3.7.4 Auto-Downspeed

The auto-downspeed (ADS) feature implements a process to renegotiate the link with a lower speed when the link quality is insufficient. The feature ensures maximum interoperability even in harsh, or inadequate, cable infrastructure environments. In particular, ADS is applied during the 2.5GBASE-T/1000BASE-T training phase. ADS is also required when the quality or characteristics of the cable in use cannot support the advertised speed.

For example, it is possible to advertise 2.5GBASE-T/1000BASE-T during ANEG when both link partners are connected via a cable that does not support the 4-pair Gigabit Ethernet mode. The MxL86289I detects such a configuration to avoid repeating link up failures and clears the 2.5GBASE-T/1000BASE-T capability in the ANEG advertisement registers. After the resulting link down, the next ANEG procedure no longer advertises 1000BASE-T/2.5GBASE-T. The next link up is done at the next advertised speed below 1000 Mbps.

The MxL86289I also executes an ADS procedure when the signal quality is not suited to a 1000BASE-T/2.5GBASE-T link up due to increased alien noise or a loop length that significantly exceeds the standard specification.

When the MxL86289I is configured not to advertise a speed capability below 1000 Mbps, the ADS feature is automatically disabled.

3.7.5 Polarity Reversal Correction

For each of the 4 pairs, the MxL86289I automatically detects and corrects any inversion of the signal polarity on the P and N signals. The detection is done during the auto-negotiation phase. The detected polarity is frozen when the link is established, and remains unchanged until the link is dropped.

The polarity corrections applied are indicated in the register: PMA_MGBT_POLARITY (register 1.130); and are valid after auto-negotiation is complete.

3.7.6 Auto-Crossover Correction

To maximize interoperability, even in inadequate wiring environments, the MxL86289I automatically performs cable crossover (MDI-X) correction. Table 22 lists the supported pair-mappings detectable and correctable by the device.

The MxL86289I automatically detects and corrects crossed cable configuration, where the transmit-receive pairing between partners does not match. The auto-crossover function is fully compliant with IEEE 802.3, Clause 40.4.4 [2], in 1000BASE-T and 2.5GBASE-T mode.

Functional Description

The corrections applied are indicated in the register: `PMA_MGBT_POLARITY` (register 1.130) and are valid when auto-negotiation is complete.

Table 22 Supported Twisted Pair Mappings on a Cat 5 or Better Cable

Crossover Modes on RJ45¹⁾		RJ45 Pinning							
Mode	Description	1	2	3	4	5	6	7	8
11	Straight cable, standard compliant	TPIAP (A+)	TPIAN (A-)	TPIBP (B+)	TPICP (C+)	TPICN (C-)	TPIBN (B-)	TPIDP (D+)	TPIDN (D-)
00	Full Gigabit Ethernet MDI-X This is standard-compliant MDI-X with pair A/B swapped and pair C/D swapped.	TPIBP (B+)	TPIBN (B-)	TPIAP (A+)	TPIDP (D+)	TPIDN (D-)	TPIAN (A-)	TPICP (C+)	TPICN (C-)

1) This pin assignment is according to TIA/EIA-568-A/B.

3.7.7 RJ45 Tab Up or Tab Down Configuration

Figure 8 shows that the RJ45 plug on the system PCB is solderable with the tab either up or down.

The difference between tab up and tab down is a swap in position between A and D, and a swap in position between B and C. The pin strap `PS_RJ45_TAB` allows the system designer to perform this configuration. As a result, a PCB layout does not need to be modified when a RJ45 tab up or down socket needs to be mounted. The single pin strap is applicable to all ports, which are either all tab down or all tab up.

Figure 8 RJ45 Tab Up or Tab Down Configuration

3.7.8 Wake-on-LAN

The MxL86289I supports WoL. The MxL86289I generates an interrupt to an external controller when it detects special WoL Ethernet packets. This allows the controller to enter sleep mode when there is no Ethernet traffic to process, and be woken up when traffic starts. WoL packets are detected at all link speeds. [Figure 9](#) shows the scenario when connected to an external device.

Figure 9 WoL Application Block Diagram

The most commonly used WoL packet is called a magic packet, which contains the MAC address of the device to be woken up, and an optional password called SecureON. The MAC address and the optional SecureON password relevant for the WoL logic inside the MxL86289I are configurable in the WoL MDIO registers in the Vendor Specific 2, VSPEC2 MMD, device described in [Chapter 4](#). When such a configured magic packet is received, an MDINT interrupt is issued.

[Table 23](#) gives an example programming sequence for these configuration registers.

Table 23 Programming Sequence for the Wake-on-LAN Functionality

Step	Register Access	Remark
1	MDIO.MMD.WOLAD01 = EEFF _H	Programs the fifth and sixth MAC address bytes.
2	MDIO.MMD.WOLAD23 = CCDD _H	Programs the third and fourth MAC address bytes.
3	MDIO.MMD.WOLAD45 = AAB _H	Programs the first and second MAC address bytes.
4	MDIO.MMD.WOLPW01 = 4455 _H	Programs the fifth and sixth SecureON password bytes.
5	MDIO.MMD.WOLPW23 = 2233 _H	Programs the third and fourth SecureON password bytes.
6	MDIO.MMD.WOLPW45 = 0011 _H	Programs the first and second SecureON password bytes.
7	MDIO.PHY.IMASK.WOL = 1 _B	Enables the wake-on-LAN interrupt mask.
8	MDIO.MMD.WOLCTRL.WOL.EN = 1 _B	Enables wake-on-LAN functionality.

3.8 Ethernet SerDes Interface

The MxL86289I implements two Ethernet serial data interfaces. [Table 24](#) lists the data rates supported by the USXGMII interface.

The external PHY is able to initiate clause 37 auto-negotiation to change speed and new link up. In USXGMII mode, the interface supports the Packet Control Header (PCH) over preamble to transport control or timestamp indications between the MAC and the PHY.

Table 24 Ethernet SerDes Interface Feature List

Modes	Baudrate	Coding	Link Speed	IEEE Clause	Auto-Negotiation Clause
10G-QXGMII	10.3125 GT/s	64b/66b	2.5 Gbps, 1 Gbps, 100 Mbps, and 10 Mbps	49	37

3.8.1 Ethernet SerDes Interface Configuration at Power On

The MxL86289I USXGMII interface is configured to operate automatically after reset. It is not necessary for the STA to change the VSPEC1_PM_CTRL.USXGMII_REACH register to operate in this default mode.

These are the steps in the default process:

1. USXGMII auto-negotiation is enabled by default.
2. The TPI configuration after link up defines the corresponding USXGMII PHY-side port configuration. The MAC-side SoC must configure its USXGMII MAC-side interface to match the MxL86289I PHY-side configuration.
3. The MxL86289I API describes the procedure to update the Rx/Tx equalization parameters. The MxL86289I automatically updates the Rx/Tx equalization parameters for standard trace lengths based on the trace length programmed in VSPEC1_PM.USXGMII_REACH. For custom trace lengths, the Rx/Tx equalization parameters are configured using the API. Contact MaxLinear for access to the API documentation.

3.9 LED Interface

This section describes the LED interface.

3.9.1 LED

The MxL86289I allows 16 synchronized LEDs to be used for visual status indication. Each LED pin drives either a single color LED or dual color LED.

3.9.2 LED Configuration

The MxL86289I API describing the driver software executed on the Host SoC must be followed to configure this interface.

Figure 10 shows the external LED connected to either ground or the power rail in single color mode.

Figure 11 and **Figure 12** show the connection of single and dual color LEDs when the pin is also used for pin strapping.

Note: These figures do not show the full recommended circuits with all the necessary components. Refer to the relevant HDK/EVK PCB design documentation for more details.

Figure 10 LED Connection Options to Ground or Power Supply

Functional Description

Figure 11 Connection of a Dual Color LED and Configuring Pin Strap Value

Figure 12 Connection of a Single Color LED and Configuring Pin Strap Value

3.9.3 LED Brightness Control

There are two LED brightness modes configurable by the API , based on the system requirement.

- LED Brightness Level Maximum Mode
Fixed level signal (no pulses) for maximum brightness, also available as a control signal for other purposes.
- LED Brightness Level Control Mode (Constant Mode)
Allows the configuration of 16 levels of LED brightness. See [Brightness Control](#).

Brightness Control

This block controls the brightness of the LED by controlling the time duration for which the LED is on/off. The persistence characteristic of the eye causes it to perceive this as LED brightness. When LED is off, the output is disabled. When the LED is on, the output is enabled. The brightness control affects the LED output enable directly.

[Figure 13](#) shows the brightness control frequency is 81.25 Hz, where each period is divided into 64 slots.

In the LED brightness level maximum mode, the LED is enabled in all 64 slots, as shown in brightness level 0 which is the maximum brightness.

In the LED brightness level control mode, the LED is enabled for n consecutive slots, where n is determined by the configured brightness level. [Figure 13](#) shows the brightness level in active low mode, whereby brightness level 15 is the minimum brightness.

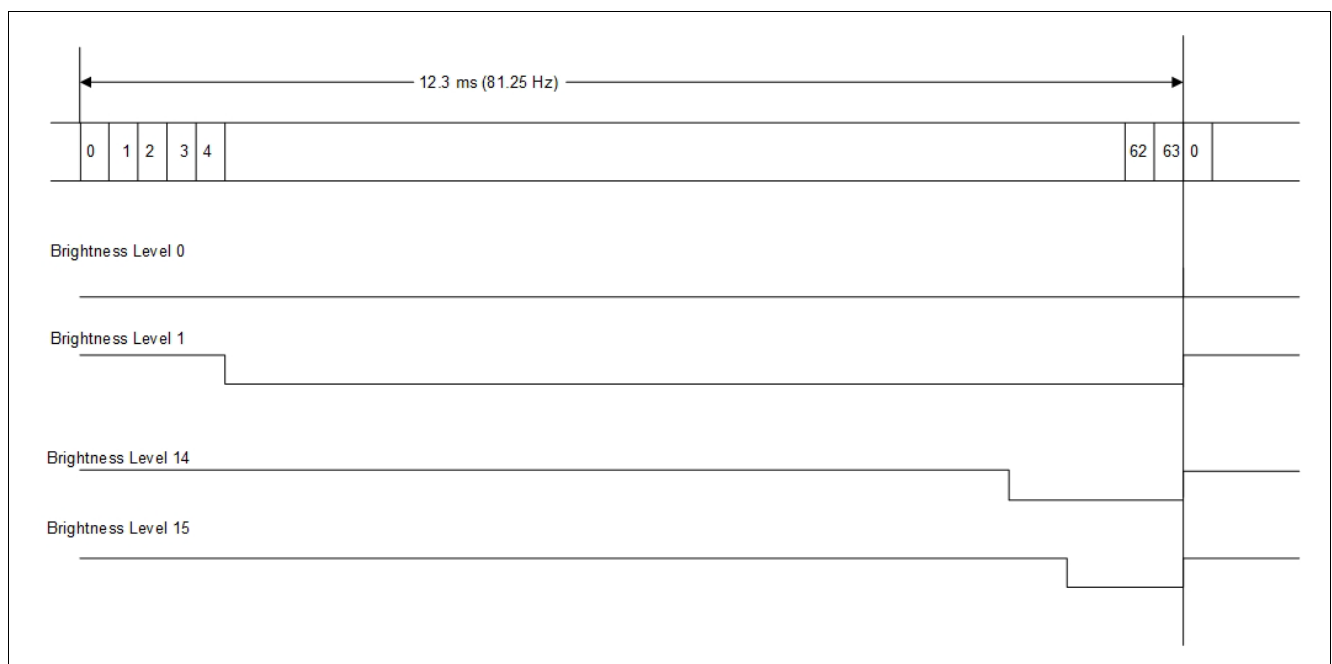

Figure 13 LED Brightness Control by Controlling LED Output Enable/Disable

3.10 Precision Time Protocol

The MxL86289I provides support for the Precision Time Protocol (PTP) feature, which is used to precisely synchronize clocks at the system level. PTP is used to synchronize the time of day (ToD) of slave clocks to a master clock over Ethernet networks. It is standardized in IEEE 1588-2002, and in IEEE 1588-2008 as a second revision (1588v2). The MxL86289I has built-in hardware support to provide high precision and easy to use PTP clock synchronization.

The MxL86289I supports PTP with these features:

- Implementation of a 64-bit counter, which counts with a granularity of 2 ns.
- Two 16 entry deep FIFOs with overflow and underflow support, one FIFO to store the timestamps and CRCs of outgoing packets, and one FIFO to store the timestamps and CRCs of incoming packets.
- Timestamps are captured with high precision in transmitted and received PTP packets when the start of frame delimiter of a packet is detected.
- Timestamps can be triggered by the edge of an input signal to allow synchronous latching of the timestamp of the on-chip counter, and the counter of an external master or slave clock to calculate counter differences. It is possible to select GPC0, GPC1, GPC2, or GPC3 as the input for the trigger signal.
- A recurring pulse signal can be generated either at the GPC0, GPC1, GPC2, or GPC3. The signal can be a Pulse Per Second (PPS) signal or a signal with another configurable frequency.

- **2-step Time Stamping**

This scheme uses a Follow_Up message to carry the time stamp of the corresponding sync message. The time stamp is not inserted in the sync message on the fly while the packet is being transmitted, but later in the next PTP message. This scheme allows the MxL86289I to perform hardware-assisted precise time stamping capture, using the PHY layer to precisely indicate when the packet Start-of-Frame Delimiter (SFD) symbol is sent out or received on the physical layer. The time stamp, together with the corresponding packet CRC, is stored in a memory area on the MxL86289I.

- **1-step Time Stamping**

This scheme is used to reduce the number of PTP messages. In this scheme, the MxL86289I MAC inserts the time stamp in the sync message on the fly when it passes through the MxL86289I MAC layer. The MxL86289I inserts the time stamp in the PTP sync message on the fly.

Attention: 1-step Time Stamping is not supported in transparent mode

3.10.1 PTP Configuration

The MxL86289I API describing the driver software executed on the external processor SoC must be followed to configure this feature.

3.11 Pulse Per Second

The MxL86289I provides support for Pulse Per Second (PPS) signal generation, which is used at the PCB level to synchronize various devices. The general purpose clock pins GPC0, GPC1, GPC2, or GPC3 are configured for this purpose.

3.11.1 PPS Configuration

The MxL86289I API describing the driver software executed on the external processor SoC must be followed to configure this feature.

3.12 Synchronous Ethernet

The MxL86289I allows a Synchronous Ethernet (SyncE) interface to support transportation of a source clock from a clock master to clock clients. When the TPI is a clock slave, the MxL86289I receives the synchronization clock from the Ethernet cable, and provides it to the system on pin GPC0, GPC1, GPC2, or GPC3. When the TPI is a clock master, the MxL86289I receives the clock from the system on pin GPC0, GPC1, GPC2, or GPC3 and sends it over the Ethernet cable as a clock master.

It is configurable to synchronize to one of these clock sources:

- Recovered received clock by SerDes
- Recovered received clock by 2.5G BASE-T PHY
- Input clock via GPC0, GPC1, GPC2, or GPC3

These functions are clocked from the synchronized clock:

- SerDes
- 2.5GBASE-T PHY
- 1588/PTP timers
- Output clock via GPC0, GPC1, GPC2, or GPC3

Loss of signal detection is integrated on chip and all the modules are supplied seamlessly with clocks generated from the local source when the external master clock signal is not available.

3.12.1 SyncE Configuration

The MxL86289I API describing the driver software executed on the external processor SoC must be followed to configure this feature.

3.13 Smart-AZ

The Smart-AZ feature is relevant when the 8-Port 2.5 Gigabit Ethernet PHY is connected to a MAC SoC that does not implement the EEE feature in its MAC layer. In this case, the MAC SoC is not able to initiate a transition to the low-power idle state.

To alleviate the limitation of such a MAC SoC, the MxL86289I detects the conditions that may lead to low-power idle and generates the control messages to enter EEE mode in accordance with the IEEE 802.3az standard.

The Smart-AZ feature is not enabled by default and is not supported in transparent mode.

3.14 Preemption

The IEEE 802.3br [2] and IEEE 802.1Qbu standards [11] introduced a one-level Ethernet frame preemption paradigm. In this approach, frames transmitted through a switch output port are classified as express frames or preemptable frames, depending on their priority levels. Express frames are able to preempt preemptable frames. Two frames belonging to the same class are not able to preempt each other. This allows the transmission of non-critical frames to be interrupted by critical frames, hence avoiding critical frames being blocked for long periods of time.

The MxL86289I does not preempt any Ethernet frames or change the order of the Ethernet frames. However, it is preemption-aware and able to identify the various preemption classes. The PCH transports preemption information over the USXGMII interface, consequently the MxL86289I also supports this feature in the PCH.

This feature is relevant in a Time Sensitive Network.

Attention: Preemption is only supported in transparent mode when the MxL86289I is not operating in 10BASE-T. Preemptable frames are dropped in SmartAZ mode.

3.15 Power Management

This section describes the power management functions of the MxL86289I integrated Ethernet PHY.

3.15.1 Power States

Figure 14 illustrates the power states and transitions of each integrated Ethernet PHY.

In this state diagram, the (0.11) syntax corresponds to the value of bit 11 from register 0 in device 0, which is `STD_CTRL.PD`. This is the Power Down (PD) bit in `MDIO STD_CTRL`, described in [Chapter 4](#). The STA is able to use this `STD_CTRL.PD` field to bring the physical interface into the **POWER DOWN State**.

The other states are automatically entered by the MxL86289I depending on the context, and following the IEEE protocol. This is done without any intervention from the STA.

The Normal Link Pulse (NLP) and Fast Link Pulse (FLP) are received on the TPI from a link partner and used to wake up the MxL86289I and enter auto-negotiation.

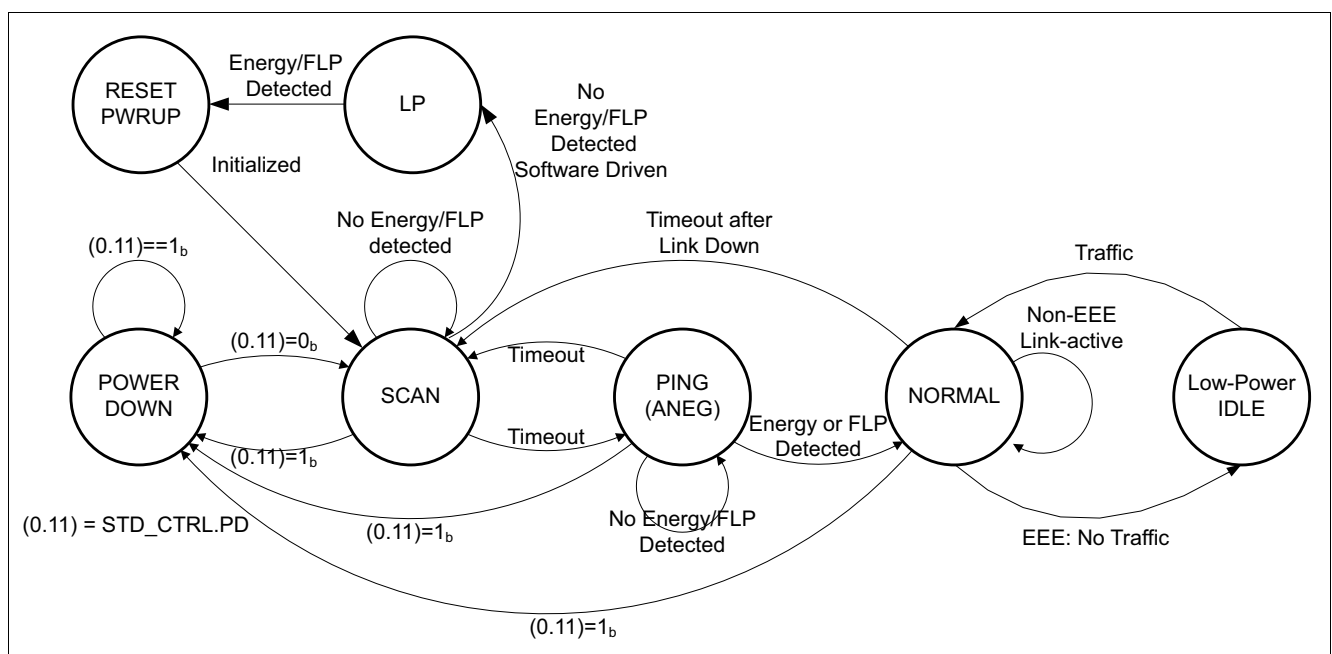

Figure 14 State Diagram for Power Down State Management

3.15.2 RESET PWRUP

The MxL86289I starts up in the RESET Power Up (PWRUP) state after either a hardware reset or power up.

After initialization, the PHYs always transition to the **SCAN (ANEG) State**.

3.15.3 POWER DOWN State

The **POWER DOWN State** is entered by setting the PD bit (0.11) of the MDIO standard register `STD_CTRL` to 1, regardless of the current state of the device. The **POWER DOWN State** corresponds to power down as specified in IEEE 802.3, Clause 22.2.4.1.5. Some signal processing blocks are stopped to save energy, but the MxL86289I still responds to MDIO messages.

Exiting the **POWER DOWN State** is triggered by setting the PD bit (0.11) of `STD_CTRL` to 0, which initiates a transition to the **SCAN (ANEG) State**.

3.15.4 SCAN (ANEG) State

The SCAN state differs from the **POWER DOWN State** in that the receiver periodically scans for signal energy or FLP bursts on the TPI. There is no transmission in this state. When an FLP burst is received, the MxL86289I enters the auto-negotiation protocol to exchange capabilities with the link partner and establish a data link in the **NORMAL State**.

3.15.5 PING (ANEG) State

The PING state is similar to the **SCAN (ANEG) State** except that the transceiver transmits an FLP burst onto the TPI for a programmable amount of time. This is used to wake potential link partners from the **POWER DOWN State**. This state corresponds to the state of ANEG described in Clause 28 of the IEEE standard [2].

3.15.6 Low-Power State

The MxL86289I's Low-Power (LP) state is enabled by configuring the MDIO register `PHY_CTL2.LP`. The LP state is entered automatically when there is no Ethernet cable connected to the MxL86289I. The MxL86289I firmware detects this condition when no energy or Link Pulse is present on the TPI and enters the LP state. It is intended to set the MxL86289I into its maximum power saving state. In this state, most digital domains are in reset. Only a minimal amount of circuitry (analog/digital) operates to detect signal energy on the receiver of a TPI and trigger a wake-up.

When the port is in the LP state, the STAs do not have access to the corresponding MDIO/MMD registers.

The LP state is exited upon detection of signal energy on the twisted pair (either NLP or FLP). The port transitions to the **RESET PWRUP** state automatically. The STA host is also able to trigger an LP state exit by applying an API to wake up the specific port that entered the LP state.

It is possible for the STA host to be informed of the LP entry condition. By setting the `PHY_IMASK.LP` bit to ACTIVE, the STA requests the MDINT interrupt from the port when the entry conditions are met. **Figure 15** shows all the LP related control bits and communication mechanism between the STA and the MxL86289I.

It is possible for the STA host to be informed of the LP exit condition. By setting the `VSPEC1_IMASK.CDET` bit to ACTIVE, the STA requests the MDINT interrupt from the port when energy on the link is detected during auto-negotiation. Even when none of the ports are in the LP state, this interrupt is triggered whenever energy is first detected on the link. When the STA triggers the LP state exit via a wake-up request, and there is no energy on the link after the LP state exit, no interrupt is asserted.

Attention: An active-high MDINT in push-pull mode (default is tristate mode) is not supported in the LP mode.

Attention: VSPEC1_IMASK.CDET is not supported in forced speed 10BASE-T/100BASE-TX mode. Auto-negotiation is required to support this feature.

Figure 15 Low Power Sequence

Functional Description
Table 25 Low Power State Entry and Exit Sequence

Step	State	Remark
1	ACTIVE The LP feature is enabled by setting <code>PHY_CTL2.LP = 1</code>	Use the MDIO register <code>PHY_CTL2.LP</code> to enable or disable the LP feature.
2	ANEG, Ability Detect	The firmware detects no energy on the cable when no FLP is received for a long period of time. When the LP feature is not enabled, this time is fixed to between 6.4 and 9.6 seconds. When the LP feature is enabled, this time is configured using the <code>VSPEC1_LOW_POWER_ENTRY_TIME.LPE_TIM</code> register. Time in seconds = 4 x value programmed. Default time is 4 seconds. (<code>VSPEC1_LOW_POWER_ENTRY_TIME.LPE_TIM = 1</code>). There is an initial time of between 2.4 and 5.6 seconds, which adds on to the programmed time.
3	LP Entry Timer	This time is configured with the <code>VSPEC1_LOW_POWER_ENTRY_TIME.LPE_TIM</code> register. The value is set in steps of 4 seconds. The default time is 4 seconds.
4	LP Entry	The MxL86289I saves MDIO LP persistent registers. An interrupt is sent to indicate entry into the LP state.
5	LP State	Power consumption is saved in this state. The MxL86289I listens to energy pulses from the link partner ANEG as a condition to trigger an exit from the LP state. Only a minimal amount of circuitry operates to detect signal energy on TPI and trigger a wake-up. The port LEDs and MDIO interface are disabled.
6	LP Exit (Option 1) Based on energy detected on the cable	The MxL86289I restores the configurations in the MDIO registers. An interrupt is sent to indicate an exit from the LP state.
7	LP Exit (Option 2) Based on a wake-up request from the STA	The STA is able to request an LP exit by using a provided API. The MxL86289I restores the configurations in the MDIO registers. No interrupt is sent to notify LP exit. Since MDIO/MMD register access is unavailable for ports in the low power state, this option is only available if there is at least one port not in the low power state.
8	ANEG, LINK-UP, and ACTIVE	The MxL86289I operates in normal power modes.

These are persistent MDIO registers saved and restored during LP entry-exit.

3.15.7 NORMAL State

The NORMAL state is used to establish and maintain a link connection. When a connection is dropped, the MxL86289I moves back into the [SCAN \(ANEG\) State](#).

3.15.8 Low Power IDLE State - Energy-Efficient Ethernet

The IEEE 802.3 standard [2] describes the EEE operation supported by the MxL86289I in the various speeds of 100BASE-TX, 1000BASE-T, and 2.5GBASE-T. The general idea of EEE is to save power during periods of low link utilization. Instead of sending active idle data, the transmitters are switched off for a short period of time. This is called the quiet period. The link is kept active by means of a frequent refresh cycle initiated by the PHY itself while in the low power state. This sequence is repeated until a wake request is generated by one of the link partner MACs. The MxL86289I follows the IEEE 802.3 standard regarding EEE. Figure 16 illustrates the principle. This state is entered automatically when the low power idle conditions are met.

Figure 16 EEE Low Power Idle Sequence

3.16 Firmware Upgrade

The MxL86289I provides a Firmware Upgrade feature that allows feature and functional enhancements of the MxL86289I in the field.

It is possible to download a new firmware image via the MxL86289I's **MDIO Slave Interface** to a serial flash memory device connected to the MxL86289I's QSPI. The MxL86289I is then able to fetch the upgraded firmware from the flash memory after a reboot.

For Security Development Lifecycle (SDL) [12] reasons, the MxL86289I only accepts firmware images electronically signed by MaxLinear. When authentication of the flash image by the MxL86289I fails, or the download of the image is aborted or fails, the MxL86289I resets and wait for a new image to be downloaded.

In flashless mode, the host MAC SoC must transfer the MxL86289I's firmware image into the MxL86289I's on-chip memory at the MxL86289I's boot-up time. MaxLinear will provide the procedure to facilitate the firmware transfer. To upgrade the MxL86289I's firmware image, the device must be put into the reset state and restarted. This allows the usual **Power-On Sequence** to occur with the newly upgraded firmware image to be downloaded over the MDIO slave interface using a dedicated MDIO address. Once the firmware image has been transferred to the MxL86289I's on-chip memory, it is authenticated. After successfully authenticating the image, the MxL86289I continues with normal boot process. If authentication fails, or the image download fails or is aborted, the MxL86289I resets and waits for the host MAC SoC to restart the process.

The supported options for upgrading the firmware image are:

- The firmware is upgradeable over the MDIO slave interface to the flash memory device.
- Firmware download over the MDIO slave interface with MDIO address 0x1F to on-chip memory in flashless mode.
- In addition firmware download into "empty" flash is supported over MDIO slave interface.

Attention: The MDIO slave interface for firmware download or upgrade supports IEEE 802.3 Clause 22 only.

Attention: The MDIO address for firmware download or upgrade to flash is defined by the pin strapping in Table 17 with the lowest three bits equal to 0.

Attention: After the firmware upgrade to the flash memory is completed, the MxL86289I must be rebooted such that the new image is authenticated. The same requirement also applies to flash memory devices that are programmed directly by customers, which do not use the firmware upgrade procedure provided in this section.

The procedure to download firmware over the MDIO slave interface is documented in [1]. It provides information on the update/download process and which actions are required in the MAC SoC application.

Security feature to prevent flash memory wear-out due to frequent updates (flash anti-wear out) is not supported within the MxL86289I. When the system to which the MxL86289I is attached mandates such features, they must be supported by the system itself. Flash memory components typically support a minimum of 100,000 erase/program cycles, so flash wear-out is unlikely. However, ensuring a minimum interval between flash updates decreases the likelihood of wear-out. An interval of one hour sets the minimum time before wear-out to longer than 11 years. The system is also expected to ensure that the firmware is only installed when a new firmware is available and does not attempt to install a new firmware after every reboot in flash mode.

Security feature to prevent rollback of the image to a previous version (anti-rollback) is supported within the MxL86289I. The MxL86289I verifies that the new firmware has a higher or same security version number (SVN) than the previously installed firmware before executing it. If this step fails due to the firmware SVN being a lower version, the MxL86289I resets itself and waits for the host SoC to download a new image to the flash memory over the MDIO slave interface. In flashless mode, the MxL86289I resets itself and waits for the host MAC SoC to restart the firmware transfer process. If the system does not desire to have this anti-rollback feature, MaxLinear will deliver firmware images with fixed SVN, such that the security check will always pass.

4 MDIO and MMD Register Interface Description

This chapter describes the MDIO and MMD registers available to support the MxL86289I feature set. These registers are accessible by an external management entity (called STA in IEEE) to control, configure, or read the status of the MxL86289I. After power-on, the MxL86289I resets the MDIO and MMD registers to default values sufficient to operate without specific programming.

All the register definitions, behaviors, and fields are strictly compliant with IEEE 802.3. Refer to IEEE 802.3 [\[2\]](#) for more information about the registers. The only registers not referenced in IEEE 802.3 are two register groups that are vendor-specific: VSPEC1 and VSPEC2. These allow custom functions related to MxL86289I.

In the register descriptions, the section or table references refer to the IEEE 802.3 [\[2\]](#).

4.1 MDIO-specific Terminology

This list describes how the common IEEE 802.3 terms relate to MDIO and MMD register concepts discussed in this chapter.

- **STA:** Station Management. A host connected to the MDIO interface. STAs are generally Media Access Controllers (MACs). The STA drives the MDIO bus as a clock master and the MxL86289I is an MDIO slave.
- **Host:** Used as a synonym of STA in this document.
- **PHY:** Physical Layer. In the MxL86289I, this encompasses Analog Signal Processing, Digital Signal Processing, and Physical Coding Sublayer (PCS). The PHY contains several sublayers that are individually manageable entities known as MDIO manageable devices (MMDs).
- **MMD:** MDIO Manageable Device. The list of MMDs available in the MxL86289I is in [Section 4.3](#).
- **Device:** In the context of the MDIO/MMD registers, a device is a register bank grouped by logical sublayers of the PHY layer.
- **Clause:** Refers to a particular section of the IEEE 802.3 standard [\[2\]](#). In particular, Clause 22 describes MDIO device 0 and Clause 45 describes the other MMDs.
- **MII:** Media Independent Interface. This encompasses the MDIO and the (G)MII as described in Clause 22. STD registers in device 0 are also called MII registers.

4.2 Register Naming and Numbering

The register numbering convention in this document is similar to that of IEEE 802.3.

The numbering syntax uses three numbers, a.b.c, as specified in IEEE 802.3, paragraph 45.1 [2], and the notation is generalized to Clause 22 registers in device 0 STD. The alphanumeric syntax also uses the same structure and uses the names of the MMD devices, registers, and register fields separated by underscores and dots.

4.2.1 Register Numbering

The syntax is as follows, with a, b, and c written as decimal numbers:

a.b.c = <DEVICE_NUMBER>.<REGISTER_NUMBER>.<FIELD_NUMBER>

When the last indicator (c) is omitted, the register numbering refers to the full register.

When a field is more than a single bit, the bit range is indicated using a colon (for example, 1:3 is the field of bits 1 to 3). In an MDIO register, the least significant bit is bit 0 and most significant bit is bit 15. All MDIO registers are 16-bit wide.

4.2.2 Register Naming

The syntax is as follows, with AA, BB, and CC written as alphanumeric strings:

AA_BB.CC = <DEVICE_NAME>_<REGISTER_NAME>.<FIELD_NAME>

When the last indicator (CC) is omitted, the register naming refers to the full register.

The fields named RES, RES1, and RES2 refer to reserved fields as per IEEE 802.3.

4.2.3 Examples

STD_STAT.ANOK is the name of the field 0.1.5, which indicates that auto-negotiation is complete.

ANEG_CTRL.ANEG_RESTART is the name of the field 7.0.9, which allows the STA to restart the Ethernet ANEG procedure.

ANEG_PHYID1 is the complete 16-bit register number 7.2, for the PHY identifier 1 number.

VSPEC1_LED1.BLINKS is the 4-bit wide field number 30.2.15:12, which contains LED1 slow blinking configuration.

4.3 MMD Devices Present in MxL86289I

The MMD devices implement groups of standardized registers under the management of the STA.

Table 26 MDIO/MMD Devices Present in MxL86289I

MDIO/MMD Name	Device Number (decimal)	Description
STD	0	MDIO Standard Device as described in Clause 22. This also contains a number of MxL86289I-specific PHY registers.
PMAPMD	1	Control and status registers related to the PMA/PMD signal processing modules
PCS	3	Control and status registers related to the PCS encoding/decoding device
ANEG	7	Control and status registers related to the auto-negotiation device
VSPEC1	30	MxL86289I-specific LED control and other MxL86289I-specific control
VSPEC2	31	MxL86289I-specific WoL control

4.4 Responsibilities of the STA

The MxL86289I responds to all published register addresses for the device and returns a value of zero for undefined and unsupported registers.

In accordance with IEEE 802.3 guidelines, it is the responsibility of the STA entity to ensure that mutually acceptable speeds are applied consistently across all the MMDs of the MxL86289I.

The MxL86289I ignores writes to the PMA/PMD speed selection bits that select speeds not advertised in the PMA/PMD speed ability register. The PMA/PMD speed selection defaults to a supported ability.

4.5 MDIO Access Protocols to Read / Write Registers

All the MDIO/MMD registers are accessible from an external chip connected to the MDIO bus on the MDIO_S and MDC_S pins. The MxL86289I supports several MDIO frame protocols:

- Clause 22: To access Device 0
- Clause 22 Extended: To access other devices using the indirection scheme specified by IEEE 802.3
 - Dev 1: PMAPMD
 - Dev 3: PCS
 - Dev 7: ANEG
 - Dev 30: VSPEC1
 - Dev 31: VSPEC2
- Clause 45: to access all devices

Both Clause 22 Extended and Clause 45 are used to access MMD devices. However, the mechanism implemented in the MxL86289I provides faster speeds using Clause 45. It creates differences in latencies in the MDIO reply:

- The Clause 22 Extended protocol involves an indirect mechanism.
- The Clause 45 protocol provides faster replies.

The Clause 22 registers are accessed using the Clause 45 electrical interface and the Clause 22 management frame structure. Refer to IEEE 802.3 section 45 [\[2\]](#).

5 MDIO Registers Detailed Description

Table 27 Register Access Type

Mode	Symbol
Read-Only Register (Status or Ability Register)	RO
Read-Write Register (MDIO Register)	RW
Read-Write Self-Clearing Register (bit cleared after read from MDIO)	RWSC
Read-Only Self-Clearing Register (bit cleared after read from MDIO)	ROSC
Read-Only Latching Low Register	ROLL
Read-Only Latching High Register	ROLH

5.1 Standard Management Registers

This section describes the IEEE 802.3 standard management registers corresponding to Clause 22.

Table 28 Registers Overview- Standard Management Registers

Register Short Name	Register Long Name	Reset Value
STD_CTRL	STD Control (Register 0.0)	3040 _H
STD_STAT	Status Register (Register 0.1)	7949 _H
STD_PHYID1	PHY Identifier 1 (Register 0.2)	C133 _H
STD_PHYID2	PHY Identifier 2 (Register 0.3)	5400 _H ¹⁾
STD_AN_ADV	Auto-Negotiation Advertisement (Register 0.4)	9DE1 _H
STD_AN_LPA	Auto-Negotiation Link Partner Ability (Register 0.5)	1DE0 _H
STD_AN_EXP	Auto-Negotiation Expansion (Register 0.6)	0064 _H
STD_AN_NPTX	Auto-Negotiation Next Page Transmit Register (Register 0.7)	2001 _H
STD_AN_NPRX	Auto-Negotiation Link Partner Received Next Page Register (Register 0.8)	0000 _H
STD_GCTRL	Gigabit Control Register (Register 0.9)	0200 _H
STD_GSTAT	Gigabit Status Register (Register 0.10)	0000 _H
STD_MMDCTRL	MMD Access Control Register (Register 0.13)	0000 _H
STD_MMDDATA	MMD Access Data Register (Register 0.14)	0000 _H
STD_XSTAT	Extended Status Register (Register 0.15)	2000 _H

1) For the device specific reset value, see the Product and Package Naming table in the [Product Ordering Information](#) chapter.

5.1.1 Standard Management Register Descriptions

This section describes all the STD registers in detail.

STD Control (Register 0.0)

This register controls the main functions of the PHY.

IEEE Standard Register=0.0

STD_CTRL

STD Control (Register 0.0)

Reset Value

3040_H

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RST	LB	SSL	ANEN	PD	ISOL	ANRS	DPLX	COL	SSM						RES
RWSC	RW	RW	RW	RW	RW	RWSC	RW	RW	RW						RO

Field	Bits	Type	Description
RST	15	RWSC	Reset Resets the PHY to its default state. Active links are terminated. This is a self-clearing bit, which is set to zero by the hardware after a reset is performed. 0 _B NORMAL Normal operational mode 1 _B RESET Resets the device.
LB	14	RW	Loopback on GMII This mode enables looping back of MII data from the transmit to the receive direction. No data is transmitted to the Ethernet PHY. The device operates at the selected speed. The collision signal remains de-asserted unless otherwise forced by the collision test. 0 _B NORMAL Normal operational mode 1 _B ENABLE Closes the loopback from Tx to Rx at xMII.
SSL	13	RW	Forced Speed Selection LSB This bit only takes effect when bit ANEN is set to zero, which disables the auto-negotiation process. This is the lower bit (LSB) of the forced speed selection and is used in conjunction with the higher bit (MSB). The standard procedure to force 2500 Mbps operation (when ANEG is disabled) is to program PMA_CTRL with 1.0.6 = 1.0.13 = 1 and 1.0.5:2 = [0 1 1 0]. The GPHY mirrors 1.0.6, 1.0.13 and 0.0.6, 0.0.13. This is the MSB LSB bit value encoding: 00 _B 10 Mbps 01 _B 100 Mbps 10 _B 1000 Mbps 11 _B Reserved, defaults to 2500 Mbps operation when the PMA_CTRL register 1.0.5:2 equals [0 1 1 0].

Field	Bits	Type	Description (cont'd)
ANEN	12	RW	Auto-Negotiation Enable Allows enabling and disabling of the auto-negotiation process capability of the PHY. When enabled, the force bits for duplex mode (CTRL.DPLX) and the speed selection (CTRL.SSM, CTRL.SSL) become inactive; otherwise, the force bits define the PHY operation. 0 _B DISABLE Disables the auto-negotiation protocol. 1 _B ENABLE Enables the auto-negotiation protocol.
PD	11	RW	Power Down Forces the device into a power down state (SLEEP) in which power consumption is the bare minimum required to still maintain the MII management interface communication. When activating the power down functionality, the PHY terminates active data links. The MII interface is also stopped in power down mode. 0 _B NORMAL Normal operational mode 1 _B POWERDOWN Forces the device into power down mode.
ISOL	10	RW	Isolate The isolation mode isolates the PHY from the MAC. The MAC interface inputs are ignored, whereas the MAC interface outputs are set to tristate (high-impedance). 0 _B NORMAL Normal operational mode 1 _B ISOLATE Isolates the PHY from the MAC.
ANRS	9	RWSC	Restart Auto-Negotiation Restarts the auto-negotiation process on the MDI. This bit does not have any effect when auto-negotiation is disabled using CTRL.ANEN. This bit is self-clearing after the auto-negotiation process is initiated. 0 _B NORMAL Stays in current mode. 1 _B RESTART Restarts auto-negotiation.
DPLX	8	RW	Forced Duplex Mode This bit only takes effect when bit CTRL.ANEN is set to zero, which disables the auto-negotiation process. This bit controls the forced duplex mode. It allows forcing of the PHY into full-duplex or half-duplex mode. This bit does not take effect in loopback mode, when bit CTRL.LB is set to 1 _B . It is only possible to force the duplex mode to half-duplex in 10BASE-T and 100BASE-TX speed modes. This field is ignored for higher speeds. 0 _B HD Half-duplex 1 _B FD Full-duplex
COL	7	RW	Collision Test Allows testing of the COL signal at the xMII interface. When the collision test is enabled, the state of the TX_EN signal is looped back to the COL signal within a minimum latency. 0 _B DISABLE Normal operational mode 1 _B ENABLE Activates the collision test.

Field	Bits	Type	Description (cont'd)
SSM	6	RW	<p>Forced Speed Selection MSB</p> <p>This bit only takes effect when bit ANEN is set to zero, which disables the auto-negotiation process. This is the higher bit (MSB) of the forced speed selection and is used in conjunction with the lower bit (LSB).</p> <p>The preferred way to force 2500 Mbps operation (when ANEG is disabled) is to program PMA_CTRL with 1.0.6 = 1.0.13 = 1 and 1.0.5:2 = [0 1 1 0].</p> <p>The GPHY mirrors 1.0.6, 1.0.13 and 0.0.6, 0.0.13.</p> <p>This is the MSB LSB bit value encoding:</p> <p>00_B 10 Mbps 01_B 100 Mbps 10_B 1000 Mbps 11_B Reserved, defaults to 2500 Mbps operation when the PMA_CTRL register 1.0.5:2 equals [0 1 1 0].</p>
RES	5:0	RO	<p>Reserved</p> <p>Write as zero, ignore on read.</p>

Status Register (Register 0.1)

This register contains status and capability information about the device. All the bits are read-only. A write access by the MAC does not have any effect. Refer to IEEE 802.3 22.2.4.2.

IEEE Standard Register=0.1

STD_STAT
Status Register (Register 0.1)

Otherwise, both the DEVAD field and the MMD address register direct the MMDDATA register data accesses to the appropriate registers within that MMD. 00 _B ADDRESS Accesses to the MMDDATA register access the MMD individual address register. 01 _B DATA Accesses to the MMDDATA register access the register within the MMD selected. 10 _B DATA_PI Accesses to the MMDDATA register access the register within the MMD selected. 11 _B DATA_PIWR Accesses to the MMDDATA register access the register within the MMD selected.
RESH	13:8	RO	Reserved Write as zero, ignored on read.
RESL	7:5	RO	Reserved Write as zero, ignored on read.
DEVAD	4:0	RW	Device Address The DEVAD field directs any accesses of register MMDDATA to the appropriate MMD as described in IEEE 802.3-2008 Clause 45.2.

MMD Access Data Register (Register 0.14)

The MMD access data register is used in conjunction with the MMD access control (MMDCTRL) register to access the MMD register space. For more information on MMD access, refer to IEEE 802.3-2008 Clause 22.2.4.3.12, Clause 45.2, and Annex 22D.

IEEE Standard Register=0.14

STD_MMDDATA

Reset Value

MMD Access Data Register (Register 0.14)

0000_H

Field	Bits	Type	Description
ADDR_DATA	15:0	RW	Address or Data Register This register accesses either a specific MMD address register or the data content of the MMD register to which this address register points. The MMDCTRL register defines which function is currently valid.

Extended Status Register (Register 0.15)

This register contains extended status and capability information about the PHY. All the bits are read-only. A write access does not have any effect.

IEEE Standard Register=0.15

PHY_FWV	Firmware Version Register (Register 0.30)	0000 _H

5.2.1 PHY-specific Management Register Descriptions

This section describes all the PHY registers in detail.

Physical Layer Status 1 (Register 0.17)

This register reports PHY link information, for example link-up, polarity reversals, and port mapping. The content of this register is only valid when the link is up.

IEEE Standard Register=0.17

PHY_STAT1

Physical Layer Status 1 (Register 0.17)

Reset Value

000C_H

Field	Bits	Type	Description
RES2	15:9	RO	Reserved Write as zero, ignored on read.
LSADS	8	ROSC	Link Speed Auto-Downspeed Status Monitors the status of the Auto-Downspeed (ADS). 0 _B NORMAL Did not perform any link speed ADS. 1 _B DETECTED Detected an ADS.
FW_MEM	3:2	RW	Firmware Memory Location Indicates memory target used for firmware execution. 11 _B RAM Firmware is executed from SRAM. Others: Reserved.
RES1	1:0	RO	Reserved Write as zero, ignored on read.

Physical Layer Control 1 (Register 0.19)

This register controls the PHY functions.

IEEE Standard Register=0.19

PHY_CTL1

Physical Layer Control 1 (Register 0.19)

Reset Value

0001_H

POLA	4	RW	Polarity Inversion Control on Port A 0 _B NORMAL Polarity normal 1 _B INVERTED Polarity inversion
MDICD	3	RW	Mapping of MDI Ports C and D Used when Auto-MDIX is OFF to force the MDIX cable crossover configuration. 0 _B MDI Normal MDI mode 1 _B MDIX Crossover MDI-X mode

Field	Bits	Type	Description (cont'd)
MDIAB	2	RW	Mapping of MDI Ports A and B Used when Auto-MDIX is OFF to force the MDIX cable crossover configuration. 0 _B MDI Normal MDI mode 1 _B MDIX Crossover MDI-X mode
RES	1	RO	Reserved
AMDIX	0	RW	PHY Performs Auto-MDI/MDI-X or Uses Manual MDI/MDI-X 0 _B MANUAL PHY uses manual MDI/MDI-X. 1 _B AUTO PHY performs Auto-MDI/MDI-X.

Physical Layer Control 2 (Register 0.20)

This register controls the PHY functions.

IEEE Standard Register=0.20

PHY CTL2

Reset Value

Physical Layer Control 2 (Register 0.20)

0006_H

15					10	9	8	7		5	4	3	2	1	0
RES						SDET P	STICK Y	RES1		RES2		LP	PSCL	ANPD	LPI
						rw	rw	ro		rw		rw	rw	rw	rw

Field	Bits	Type	Description
SDETP	9	RW	Signal Detection Polarity for the 1000BASE-X PHY This field is reserved because 1000BASE-X is not supported on this PHY port.
STICKY	8	RW	Sticky-Bit Handling Setting this bit to 1 _B ensures that all the vendor specific registers (of type RW) in the PHY (device 0), VSPEC1 (device 30), and VSPEC2 (device 31) are not changed during a MDIO reset or software reset of the GPHY. This allows the STA to keep the configurations chosen before reset. 0 _B OFF Sticky-bit handling is disabled. 1 _B ON Sticky-bit handling is enabled.
RES1	7:5	RO	Reserved Write as zero, ignored on read.
RES2	4	RW	Reserved
LP	3	RW	Low Power Mode Low Power Mode (LP) allows the GPHY to save energy by disabling most of the digital logic to reduce power consumption to its lowest level. The entry to LP is triggered when the PHY does not sense any energy on the cable and no link pulses (NLP, FLP, Beacons) are received. After spending VSPEC1_NBT_DS_CTRL.NRG_RST_CNT without energy in the ABILITY_DETECT state defined by IEEE 802.3 Clause 28, and after the timer defined VSPEC1_LOW_POWER_ENTRY_TIME.LPE_TIM expired, the PHY enters LP. 0 _B OFF LP is disabled. The GPHY does not enter LP. 1 _B ON LP is enabled. The GPHY enters LP when no energy is sensed.
PSCL	2	RW	Power Consumption Scaling Depending on Link Quality Allows enabling/disabling of the power consumption scaling depending on the link quality. 0 _B OFF PSCL is disabled. 1 _B ON PSCL is enabled.

Field	Bits	Type	Description (cont'd)
ANPD	1	RW	Auto-Negotiation Power Down Allows enabling/disabling of the power down modes during auto-negotiation looking for a link partner. 0 _B OFF ANPD is disabled. 1 _B ON ANPD is enabled.
LPI	0	RW	Assert LPI via MDIO Controls assertion/de-assertion of the LPI by the MDIO instead of following the (X)GMII LPI. Used to force the EEE on the TPI (ignoring the LPI indication from MAC). 0 _B DE-ASSERT LPI is de-asserted on TPI. 1 _B ASSERT LPI is asserted on TPI.

Error Counter (Register 0.21)

This register controls the error counter. It allows the number of errors detected in the PHY to be counted for monitoring purposes.

IEEE Standard Register=0.21

PHY_ERRCNT

Error Counter (Register 0.21)

Reset Value

0000_H

Field	Bits	Type	Description
RES	15:12	RO	Reserved Write as zero, ignored on read.
SEL	11:8	RW	Select Error Event Configures which error type the error counter counts: 0000 _B RXERR Receive errors are counted. 0001 _B RXACT Receive frames are counted. 0010 _B ESDERR ESD errors are counted. 0011 _B SSDERR SSD errors are counted. 0100 _B TXERR Transmit errors are counted. 0101 _B TXACT Transmit frames events are counted. 0110 _B COL Collision events are counted. 1000 _B NLD Number of Link Down events are counted. 1001 _B NDS Number of ADS events are counted. 1010 _B RES Reserved 1011 _B RES Reserved
COUNT	7:0	ROSC	Counter Value This counter value is updated each time the selected error event is detected. The counter value is reset every time a read operation on this register is performed or the error event is changed. The counter saturates at value FF _H .

Media-Independent Interface Status (Register 0.24)

This register contains status information on the Ethernet link, concatenated in a single register to allow concise status read by the STA in a single register.

IEEE Standard Register=0.24

PHY_MIISTAT
Reset Value

rosc	rosc	rosc	rosc	rosc	rosc	rosc	rosc	rosc	rosc	rosc	rosc	rosc	rosc	rosc	rosc

Field	Bits	Type	Description
WOL	15	ROSC	Wake-on-LAN Interrupt Status When this bit is set, the MDINT is activated upon detection of a valid WoL event. 0 _B INACTIVE This event is not the interrupt source. 1 _B ACTIVE The WoL event is the source of the interrupt.
MSRE	14	ROSC	Master/Slave Resolution Error Interrupt Status When this bit is set, the MDINT is activated upon detection of a MSRE during a 1000BASE-T ANEG. 0 _B INACTIVE This event is not the interrupt source. 1 _B ACTIVE The MSRE event is the source of the interrupt.
NPRX	13	ROSC	Next Page Received Interrupt Status When this bit is set, the MDINT is activated upon reception of a next page in STD_AN_NPRX. 0 _B INACTIVE This event is not the interrupt source. 1 _B ACTIVE The NPRX event is the source of the interrupt.
NPTX	12	ROSC	Next Page Transmitted Interrupt Status When this bit is set, the MDINT is activated upon transmission of the currently stored next page in STD_AN_NPTX. 0 _B INACTIVE This event is not the interrupt source. 1 _B ACTIVE The NPTX event is the source of the interrupt.
ANE	11	ROSC	Auto-Negotiation Error Interrupt Status When this bit is set, the MDINT is activated upon detection of an ANEG error. 0 _B INACTIVE This event is not the interrupt source. 1 _B ACTIVE The ANEG error event is the source of the interrupt.
ANC	10	ROSC	Auto-Negotiation Complete Interrupt Status When this bit is set, the MDINT is activated upon completion of the ANEG process. 0 _B INACTIVE This event is not the interrupt source. 1 _B ACTIVE The ANEG complete event is the source of the interrupt.

Field	Bits	Type	Description (cont'd)
LOR	8	ROSC	SyncE Loss Of Reference When this bit is set, MDINT is activated upon loss of SyncE reference clock. 0 _B INACTIVE This event is not the interrupt source. 1 _B ACTIVE The LOR change event is the source of the interrupt.
LP	7	ROSC	LP Entry Indication 0 _B INACTIVE No indication of LP entry 1 _B ACTIVE Indication of LP entry.
TEMP	6	ROSC	TEMP Indicates that thermal mitigation action must be taken when the temperature goes beyond the normal operating range. The GPHY implements ADS by default when this happens, but it is possible to disable ADS. When the SoC disables ADS, it is recommended that the SoC initiates a link down and changes the speed capability to cool the device back to the normal temperature range. When the temperature reaches the maximum absolute rating, the device resets for safety purposes. Thermal mitigation must ensure that the maximum absolute temperature limits are never reached. 0 _B INACTIVE This event is not the interrupt source. 1 _B ACTIVE The TEMP change event is the source of the interrupt.
ADSC	5	ROSC	Link Speed Auto-Downspeed Detect Interrupt Status When this bit is set, the MDINT is activated upon detection of a link speed ADS event. 0 _B INACTIVE This event is not the interrupt source. 1 _B ACTIVE The ADSC change event is the source of the interrupt.
MDIPC	4	ROSC	MDI Polarity Change Detect Interrupt Status When this bit is set, the MDINT is activated upon detection of an MDI polarity change event. 0 _B INACTIVE This event is not the interrupt source. 1 _B ACTIVE The MDIPC change event is the source of the interrupt.
MDIXC	3	ROSC	MDIX Change Detect Interrupt Status When this bit is set, the MDINT is activated upon detection of an MDI/MDIX cross-over change event. 0 _B INACTIVE This event is not the interrupt source. 1 _B ACTIVE The MDIX change event is the source of the interrupt.
DXMC	2	ROSC	Duplex Mode Change Interrupt Status When this bit is set, the MDINT is activated upon detection of a full or half-duplex change. 0 _B INACTIVE This event is not the interrupt source. 1 _B ACTIVE The DXMC change event is the source of the interrupt.
LSPC	1	ROSC	Link Speed Change Interrupt Status When this bit is set, the MDINT is activated upon detection of link speed change. 0 _B INACTIVE This event is not the interrupt source. 1 _B ACTIVE The LSPC change event is the source of the interrupt.

Field	Bits	Type	Description (cont'd)
LSTC	0	ROSC	Link State Change Interrupt Status When this bit is set, the MDINT is activated upon detection of link status change. 0 _B INACTIVE This event is not the interrupt source. 1 _B ACTIVE The LSTC change event is the source of the interrupt.

LED Control Register (Register 0.27)

This register contains the control bits for direct access to the LEDs by setting the on/off LEDxDA bits (where x is from 0 to 1).

To directly control the LED, the integrated LED functions must be disabled by the LEDxEN bit in this register.

The integrated LED functions are specified in the more sophisticated LED control registers in the MMD device VSPEC1.

IEEE Standard Register=0.27

rw		rw			rw	rw	rw		rw

Field	Bits	Type	Description
TM	15:13	RW	Proprietary Test Modes ABIST and CDIAG Enters the test mode. Any value different from 6 or 7 has no effect. 110 _B CDIAG GPHY-specific cable diagnostic 111 _B ABIST GPHY-specific analog built-in self-test
RES	12:8	RW	Reserved
ABUART	7	RW	ABIST UART Output for Debug When this bit is set to 1 _B , it enables a detail report on the debug UART output. This is used to debug the feature and not for production mode, because in that case the two LED signals are not used to indicate completion or pass fail. An alternative to the UART output is to read the STB via MDIO commands. 0 _B NORMAL ABIST normal output 1 _B UART ABIST output to UART
ABRET	6	RW	ABIST ReTrig When this bis is set to 1 _B , it enables a restart of the selected ABIST test. This is used to debug the feature and not for production mode. 0 _B NORMAL Normal mode 1 _B RETRIG Restarts the current ABIST test.
ABSEL	5:4	RW	ABIST Sub-mode Selection 00 _B ANALOG ABIST analog tests 01 _B DC ABIST DC tests 01 _B RES Reserved 11 _B RES Reserved

Field	Bits	Type	Description (cont'd)
ABOPT	3:0	RW	ABIST Option for DC test 0000 _B ABIST DC test for 10BASE-T mode LD, maximum positive differential level 0001 _B ABIST DC test for 1000BASE-T mode LD, maximum positive differential level 0010 _B ABIST DC test for 10BASE-T mode LD, 0 differential level 0011 _B ABIST DC test for 1000BASE-T mode LD, 0 differential level 0100 _B ABIST DC test for 10BASE-T mode LD, maximum negative differential level 0101 _B ABIST DC test for 1000BASE-T mode LD, maximum negative differential level 0110 _B ABIST DC test for 2.5GBASE-T mode LD, maximum positive differential level 0111 _B ABIST DC test for 2.5GBASE-T mode LD, 0 differential level 1000 _B ABIST DC test for 2.5GBASE-T mode LD, maximum negative differential level

6 MMD Registers Detailed Description

Table 30 Register Access Type

Mode	Symbol
Status Register (Status or Ability Register)	RO

Read-Write Self-Clearing Register (bit is cleared after read from MDIO)	RWSC
Read-Only Self-Clearing Register (bit is cleared after read from MDIO)	ROSC

6.1 Standard PMAPMD Registers for MMD=0x01

Table 31 Registers Overview- Standard PMAPMD Registers

Register Short Name	Register Long Name	Reset Value
PMA_CTRL1	PMA/PMD Control 1 (Register 1.0)	2058 _H
PMA_STAT1	PMA/PMD Status 1 (Register 1.1)	0000 _H
PMA_DEVID1	PHY Identifier 1 (Register 1.2)	C133 _H
PMA_DEVID2	PHY Identifier 2 (Register 1.3)	5400 _H ¹⁾
PMA_SPEED_ABILITY	PMA/PMD Speed Ability (Register 1.4)	2070 _H
PMA_DIP1	Devices in Package 1 (Register 1.5)	008B _H
PMA_DIP2	Devices in Package 2 (Register 1.6)	C000 _H
PMA_CTL2	PMA/PMD Control 2 (Register 1.7)	0030 _H
PMA_STAT2	PMA/PMD Status 2 (Register 1.8)	8200 _H
PMA_EXT_ABILITY	PMA/PMD Extended Ability (Register 1.11)	41A0 _H
PMA_PACKID1	AN Package Identifier (Register 1.14)	C133 _H
PMA_PACKID2	AN Package Identifier (Register 1.15)	5400 _H ¹⁾
PMA_MGBT_EXTAB	PMAPMD Extended Ability (Register 1.21)	0001 _H
PMA_MGBT_STAT	MULTIGBASE-T Status (Register 1.129)	0000 _H
PMA_MGBT_POLARITY	MULTIGBASE-T Pair Swap and Polarity (Register 1.130)	0003 _H
PMA_MGBT_TX_PBO	MULTIGBASE-T Tx Power Backoff and PHY Short Reach Setting (Register 1.131)	0000 _H
PMA_MGBT_TEST_MODE	MULTIGBASE-T Test Mode (Register 1.132)	0000 _H
PMA_MGBT_SNR_OPMARGIN_A	MULTIGBASE-T SNR Margin Channel A (Register 1.133)	0000 _H
PMA_MGBT_SNR_OPMARGIN_B	MULTIGBASE-T SNR Margin Channel B (Register 1.134)	0000 _H
PMA_MGBT_SNR_OPMARGIN_C	MULTIGBASE-T SNR Margin Channel C (Register 1.135)	0000 _H
PMA_MGBT_SNR_OPMARGIN_D	MULTIGBASE-T SNR Margin Channel D (Register 1.136)	0000 _H
PMA_MGBT_MINMARGIN_A	MULTIGBASE-T SNR Minimum Margin Channel A (Register 1.137)	0000 _H
PMA_MGBT_MINMARGIN_B	MULTIGBASE-T SNR Minimum Margin Channel B (Register 1.138)	0000 _H
PMA_MGBT_MINMARGIN_C	MULTIGBASE-T SNR Minimum Margin Chan C (Register 1.139)	0000 _H
PMA_MGBT_MINMARGIN_D	MULTIGBASE-T SNR Minimum Margin Chan D (Register 1.140)	0000 _H
PMA_MGBT_POWER_A	MULTIGBASE-T Rx Power Channel A (Register 1.141)	0000 _H
PMA_MGBT_POWER_B	MULTIGBASE-T Rx Power Channel B (Register 1.142)	0000 _H
PMA_MGBT_POWER_C	MULTIGBASE-T Rx Power Chan C (Register 1.143)	0000 _H
PMA_MGBT_POWER_D	MULTIGBASE-T Rx Power Chan D (Register 1.144)	0000 _H
PMA_MGBT_SKEW_DELAY_0	MULTIGBASE-T Skew Delay 0 (Register 1.145)	0000 _H
PMA_MGBT_SKEW_DELAY_1	MULTIGBASE-T Skew Delay 1 (Register 1.146)	0000 _H

Table 31 Registers Overview- Standard PMAPMD Registers (cont'd)

Register Short Name	Register Long Name	Reset Value
PMA_MGBT_FAST_RETRAIN_STA_CTRL	MULTIGBASE-T Skew Delay 2 (Register 1.147)	0010 _H
PMA_TIMESYNC_CAP	PMA TimeSync Capability Indication (Register 1.1800)	0000 _H

1) For the device specific reset value, see the Product and Package Naming table in the [Product Ordering Information](#) chapter.

6.1.1 PMAPMD Register Descriptions

This section describes all the PMAPMD registers in detail.

PMA/PMD Control 1 (Register 1.0)

IEEE Standard Register=1.0

PMA_CTRL1

PMA/PMD Control 1 (Register 1.0)

Reset Value

2058_H

15	14	13	12	11	10	7	6	5	2	1	0
RST	RES	SSL	RES	LOW_POWER*	RES	SSM	SPEED_SEL	NS1	NS2		
RW		RW		RW		RW	RW		RO	RO	

Field	Bits	Type	Description
RST	15	RW	Reset 0 _B Normal operation 1 _B PMA/PMD reset
SSL	13	RW	Speed Selection (LSB) Used in conjunction with field SPEED_SEL_MSB. MSB LSB: 00 _B 10 Mbps 01 _B 100 Mbps 10 _B 1000 Mbps 11 _B Bits [5:2] select the speed (SPEED_SEL field)
LOW_POWER	11	RW	Low Power 0 _B Normal operation 1 _B Enters low power mode.
SSM	6	RW	Speed Selection (MSB) Used in conjunction with field SPEED_SEL_LSB. MSB LSB: 00 _B 10 Mbps 01 _B 100 Mbps 10 _B 1000 Mbps 11 _B Bits [5:2] select the speed (SPEED_SEL field)
SPEED_SEL	5:2	RW	Speed Selection Bit usage (from bit 5 to bit 2): 0 0 0 0 _B Not supported. The speed defaults to 2.5 Gbps. 0 0 0 1 _B Not supported. The speed defaults to 2.5 Gbps. 0 0 1 0 _B Not supported. The speed defaults to 2.5 Gbps. 0 0 1 1 _B Not supported. The speed defaults to 2.5 Gbps. 0 1 0 0 _B Not supported. The speed defaults to 2.5 Gbps. 0 1 0 1 _B Not supported. The speed defaults to 2.5 Gbps. 0 1 1 0 _B 2.5 Gbps 0 1 1 1 _B Not supported 1 x x x _B Reserved

Field	Bits	Type	Description (cont'd)
NS1	1	RO	Not Supported PMA remote loopback mode is not supported by the GPHY.
NS2	0	RO	Not Supported PMA local loopback mode is not supported by the GPHY.

PMA/PMD Status 1 (Register 1.1)

IEEE Standard Register=1.1

PMA_STAT1

PMA/PMD Status 1 (Register 1.1)

Reset Value

0000_H

Field	Bits	Type	Description
FAULT	7	RO	Fault 0 _B Fault condition not detected 1 _B Fault condition detected
RX_LINK_STATUS	2	RO	Receive Link Status 0 _B PMA/PMD receive link down 1 _B PMA/PMD receive link up
LOW_POWER_ABILITY	1	RO	Low Power Ability 0 _B PMA/PMD does not support low power mode. 1 _B PMA/PMD supports low power mode.

PHY Identifier 1 (Register 1.2)

IEEE Standard Register=1.2

Bits 31 - 16 of device ID

PMA_DEVID1

Reset Value

PHY Identifier 1 (Register 1.2)

C133_H

Field	Bits	Type	Description
OUI	15:0	RO	Organizationally Unique Identifier Organizationally Unique Identifier Bits 3:18

PHY Identifier 2 (Register 1.3)

IEEE Standard Register=1.3

Bits 15 - 0 of device ID

PMA_DEVID2

PHY Identifier 2 (Register 1.3)

Reset Value

5400_H

Field	Bits	Type	Description
OUI	15:10	RO	Organizationally Unique Identifier Bits 19:24
LDN	9:4	RO	Device Number Specifies the device number ¹⁾ to distinguish between several different products.
LDRN	3:0	RO	Device Revision Number Specifies the device revision number ¹⁾ to distinguish between several versions of this device.

1) For the device specific reset value, see the Product and Package Naming table in the [Product Ordering Information](#) chapter.

PMA/PMD Speed Ability (Register 1.4)

IEEE Standard Register=1.4

PMA_SPEED_ABILITY

Reset Value

PMA/PMD Speed Ability (Register 1.4)

MULTIGBASE-T SNR Margin Channel A (Register 1.133)

Register 1.133 contains the current SNR operating margin measured at the slicer input for channel A for the MULTIGBASE-T PMA.

IEEE Standard Register=1.133

PMA_MGBT_SNR_OPMARGIN_A

Reset Value

MULTIGBASE-T SNR Margin Channel A (Register 1.133)

0000_H

Field	Bits	Type	Description
OPMARGIN_A	15:0	RO	OPMARGIN_A SNR operating margin measured at the slicer input for channel A

MULTIGBASE-T SNR Margin Channel B (Register 1.134)

Register 1.134 contains the current SNR operating margin measured at the slicer input for channel B for the MULTIGBASE-T PMA.

IEEE Standard Register=1.134

PMA_MGBT_SNR_OPMARGIN_B

Reset Value

MULTIGBASE-T SNR Margin Channel B (Register 1.134)

0000_H

Field	Bits	Type	Description
OPMARGIN_B	15:0	RO	OPMARGIN_B SNR operating margin measured at the slicer input for channel B

MULTIGBASE-T SNR Margin Channel C (Register 1.135)

Register 1.135 contains the current SNR operating margin measured at the slicer input for channel C for the MULTIGBASE-T PMA.

IEEE Standard Register=1.135

PMA_MGBT_SNR_OPMARGIN_C

Reset Value

MULTIGBASE-T SNR Margin Channel C (Register 1.135)

0000_H

Field	Bits	Type	Description
OPMARGIN_C	15:0	RO	OPMARGIN_C SNR operating margin measured at the slicer input for channel C

MULTIGBASE-T SNR Margin Channel D (Register 1.136)

Register 1.136 contains the current SNR operating margin measured at the slicer input for channel D for the MULTIGBASE-T PMA.

IEEE Standard Register=1.136

PMA_MGBT_SNR_OPMARGIN_D

Reset Value

MULTIGBASE-T SNR Margin Channel D (Register 1.136)

0000_H

Field	Bits	Type	Description
OPMARGIN_D	15:0	RO	OPMARGIN_D SNR operating margin measured at the slicer input for channel D

MULTIGBASE-T SNR Minimum Margin Channel A (Register 1.137)

The minimum margin channel A register contains a latched copy of the lowest value observed in the SNR operating margin channel A register (1.133) since the last read.

IEEE Standard Register=1.137

PMA_MGBT_MINMARGIN_A

Reset Value

MULTIGBASE-T SNR Minimum Margin Channel A (Register 1.137)

0000_H

Field	Bits	Type	Description
MINMARGIN_A	15:0	RO	MINMARGIN_A Lowest value observed in the SNR operating margin channel A register (1.133) since the last read

MULTIGBASE-T SNR Minimum Margin Channel B (Register 1.138)

The minimum margin channel A register contains a latched copy of the lowest value observed in the SNR operating margin channel B register (1.134) since the last read.

IEEE Standard Register=1.138

PMA_MGBT_MINMARGIN_B

Reset Value

MULTIGBASE-T SNR Minimum Margin Channel B (Register 1.138)

0000_H

Field	Bits	Type	Description
MINMARGIN_B	15:0	RO	MINMARGIN_B Lowest value observed in the SNR operating margin channel B register (1.134) since the last read

MULTIGBASE-T SNR Minimum Margin Chan C (Register 1.139)

The minimum margin channel C register contains a latched copy of the lowest value observed in the SNR operating margin channel C register (1.135) since the last read.

IEEE Standard Register=1.139

PMA_MGBT_MINMARGIN_C

Reset Value

MULTIGBASE-T SNR Minimum Margin Chan C (Register 1.139)

0000_H

Field	Bits	Type	Description
MINMARGIN_C	15:0	RO	MINMARGIN_C Lowest value observed in the SNR operating margin channel C register (1.135) since the last read

MULTIGBASE-T SNR Minimum Margin Chan D (Register 1.140)

The Minimum margin channel D register contains a latched copy of the lowest value observed in the SNR operating margin channel D register (1.136) since the last read.

IEEE Standard Register=1.140

PMA_MGBT_MINMARGIN_D

Reset Value

MULTIGBASE-T SNR Minimum Margin Chan D (Register 1.140)

0000_H

Field	Bits	Type	Description
MINMARGIN_D	15:0	RO	MINMARGIN_D Lowest value observed in the SNR operating margin channel D register (1.136) since the last read

MULTIGBASE-T Rx Power Channel A (Register 1.141)

The Rx signal power channel A register is read only and contains the receive signal power measured at the MDI during training as described in 55.4.3.1.

IEEE Standard Register=1.141

PMA_MGBT_POWER_A

Reset Value

MULTIGBASE-T Rx Power Channel A (Register 1.141)

0000_H

Field	Bits	Type	Description
POWER_A	15:0	RO	POWER_A Receive signal power measured at the MDI during training

MULTIGBASE-T Rx Power Channel B (Register 1.142)

The Rx signal power channel B register is read only and contains the receive signal power measured at the MDI during training as described in 55.4.3.1.

IEEE Standard Register=1.142

PMA_MGBT_POWER_B

Reset Value

MULTIGBASE-T Rx Power Channel B (Register 1.142)

0000_H

Field	Bits	Type	Description
POWER_B	15:0	RO	POWER_B Receive signal power measured at the MDI during training

MULTIGBASE-T Rx Power Chan C (Register 1.143)

The Rx signal power channel C register is read only and contains the receive signal power measured at the MDI during training as described in 55.4.3.1.

IEEE Standard Register=1.143

PMA_MGBT_POWER_C

Reset Value

MULTIGBASE-T Rx Power Chan C (Register 1.143)

0000_H

Field	Bits	Type	Description
POWER_C	15:0	RO	POWER_C Receive signal power measured at the MDI during training

MULTIGBASE-T Rx Power Chan D (Register 1.144)

The Rx signal power channel D register is read only and contains the receive signal power measured at the MDI during training as described in 55.4.3.1.

IEEE Standard Register=1.144

PMA_MGBT_POWER_D

Reset Value

MULTIGBASE-T Rx Power Chan D (Register 1.144)

0000_H

Field	Bits	Type	Description
POWER_D	15:0	RO	POWER_D Receive signal power measured at the MDI during training

MULTIGBASE-T Skew Delay 0 (Register 1.145)

IEEE Standard Register=1.145

The skew delay reports the current skew delay on each of the pairs with respect to physical pair A. It is reported with 1.25 ns resolution to an accuracy of 2.5 ns. The number is in two's complement notation with positive values representing delay and negative values representing advance with respect to physical pair A. When the delay exceeds the maximum amount represented by the range -80 ns to +78.75 ns, the field displays the maximum value.

PMA_MGBT_SKEW_DELAY_0

Reset Value

MULTIGBASE-T Skew Delay 0 (Register 1.145)

0000_H

Field	Bits	Type	Description
SKEW_DELAY_B	14:8	RO	Skew Delay B Skew delay for pair B

MULTIGBASE-T Skew Delay 1 (Register 1.146)

IEEE Standard Register=1.146

The skew delay reports the current skew delay on each of the pairs with respect to physical pair A. It is reported with 1.25 ns resolution to an accuracy of 2.5 ns. The number is in two's complement notation with positive values representing delay and negative values representing advance with respect to physical pair A. When the delay exceeds the maximum amount represented by the range -80 ns to +78.75 ns, the field displays the maximum value.

PMA_MGBT_SKEW_DELAY_1

Reset Value

MULTIGBASE-T Skew Delay 1 (Register 1.146)

0000_H

Field	Bits	Type	Description
SKEW_DELAY_D	14:8	RO	Skew Delay D Skew delay for pair D
SKEW_DELAY_C	6:0	RO	Skew Delay C Skew delay for pair C

MULTIGBASE-T Skew Delay 2 (Register 1.147)

IEEE Standard Register=1.147

PMA_MGBT_FAST_RETRAIN_STA_CTRL MULTIGBASE-T Skew Delay 2 (Register 1.147)

Reset Value

0010_H

15	11	10	6	5	4	3	2	1	0
LP_FAST_RETRAIN_COUNT				RES	FAST_RE*	FAST_RE*	FAST_RETRAIN_SIG*	FAST_RE*	
ro					ro	ro	rw	rw	

Field	Bits	Type	Description
LP_FAST_RETRAIN_COUNT	15:11	RO	LP Fast Retrain Count Counts the number of fast retrains requested by the link partner.
LD_FAST_RETRAIN_COUNT	10:6	RO	LD Fast Retrain Count Counts the number of fast retrains requested by the local device.
FAST_RETRAIN_ABILITY	4	RO	Fast Retrain Ability 0 _B Fast retrain capability is not supported. 1 _B Fast retrain capability is supported.
FAST_RETRAIN_NEGOTIATED	3	RO	Fast Retrain Negotiated 0 _B Fast retrain capability was not negotiated. 1 _B Fast retrain capability was negotiated.
FAST_RETRAIN_SIG_TYPE	2:1	RW	Fast Retrain Signal Type 00 _B PHY signals IDLE during fast retrain 01 _B PHY signals local fault during fast retrain 10 _B PHY signals link interruption during fast retrain 11 _B Reserved
FAST_RETRAIN_ENABLE	0	RW	Fast Retrain Enable 0 _B Fast retrain capability is disabled. 1 _B Fast retrain capability is enabled.

PMA TimeSync Capability Indication (Register 1.1800)

PMA TimeSync Capability indication register.

GPHY does not support providing data path delay information.

IEEE Standard Register=1.1800

PMA_TIMESYNC_CAP

PMA TimeSync Capability Indication (Register 1.1800)

Reset Value

0000_H

Field	Bits	Type	Description
TXDEL	1	RO	Transmit Data Path Delay Information Not supported by the GPHY. 0 _B NONE PHYs do not have this capability. 1 _B CAPABLE Minimum and maximum Tx data path delay available
RXDEL	0	RO	Receive Data Path Delay Information Not supported by the GPHY. 0 _B NONE PHYs do not have this capability. 1 _B CAPABLE Minimum and maximum Rx data path delay available

6.2 Standard PCS Registers

This section describes the PCS registers for MMD device 0x03.

Table 32 Registers Overview- Standard PCS Registers

Register Short Name	Register Long Name	Reset Value
PCS_CTRL1	PCS Control 1 (Register 3.0)	205C _H
PCS_STAT1	PCS Status 1 (Register 3.1)	0000 _H
PCS_DEVID1	PHY Identifier 1 (Register 3.2)	C133 _H
PCS_DEVID2	PHY Identifier 2 (Register 3.3)	5400 _H ¹⁾
PCS_SPEED_ABILITY	PCS Speed Ability (Register 3.4)	0040 _H
PCS_DIP1	PCS Devices in Package 1 (Register 3.5)	008B _H
PCS_DIP2	PCS Devices in Package 2 (Register 3.6)	C000 _H
PCS_CTRL2	PCS Control 2 (Register 3.7)	000A _H
PCS_STAT2	PCS Status 2 (Register 3.8)	9000 _H
PCS_PACKID1	PCS Package Identifier 1 (Register 3.14)	C133 _H
PCS_PACKID2	PCS Package Identifier 2 (Register 3.15)	5400 _H ¹⁾
PCS_EEE_CAP	PCS EEE Capability (Register 3.20)	0006 _H
PCS_EEE_CAP2	EEE Control and Capability 2 (Register 3.21)	0001 _H
PCS_EEE_WAKERR	PCS EEE Status Register 1 (Register 3.22)	0000 _H
PCS_2G5_STAT1	BASE-R and 10GBASE-T PCS Status 1 (Register 3.32)	0000 _H
PCS_2G5_STAT2	MULTIGBASE-T PCS Status 2 (Register 3.33)	0000 _H
PCS_TIMESYNC_CAP	PCS TimeSync Capability Register (Register 3.1800)	0000 _H

1) For the device specific reset value, see the Product and Package Naming table in the [Product Ordering Information](#) chapter.

6.2.1 PCS Register Descriptions

This section describes all the PCS registers in detail.

PCS Control 1 (Register 3.0)

IEEE Standard Register=3.0

PCS_CTRL1

PCS Control 1 (Register 3.0)

Reset Value

205C_H

15	14	13	12	11	10	9	7	6	5	2	1	0
RST	LOOPBACK	SSL	RES	LOW_POWER*	RXCKST	RES		SSM	SPEED_SEL		RES	
RW	RW	RW		RW	RW			RW	RW			

Field	Bits	Type	Description
RST	15	RW	Reset 0 _B Normal operation 1 _B PCS reset - Self-clearing
LOOPBACK	14	RW	Loopback 0 _B Disable loopback mode 1 _B Enable loopback mode
SSL	13	RW	Forced Speed Selection (LSB) This bit is used in conjunction with SPEED_SEL_LSB. The bit assignment order is: MSB LSB 00 _B 10 Mbps 01 _B 100 Mbps 10 _B 1000 Mbps 11 _B Bits [5:2] select the speed
LOW_POWER	11	RW	Low Power 0 _B Normal operation 1 _B Low-power mode
RXCKST	10	RW	Clock Stop Enable The MAC sets this bit to active to allow the GPHY to stop the clocking during the LPI_MODE. 0 _B The clock is not stoppable. 1 _B The GPHY stops the (X)GMII clock during LPI.
SSM	6	RW	Forced Speed Selection (MSB) This bit is used in conjunction with SPEED_SEL_MSB. The bit assignment order is: MSB LSB 00 _B 10 Mbps 01 _B 100 Mbps 10 _B 1000 Mbps 11 _B Bits [5:2] select the speed

Field	Bits	Type	Description (cont'd)

6.3.1 ANEG Register Descriptions

This section describes all the ANEG registers in detail.

Auto-Negotiation Control (Register 7.0)

The register controls the main function of auto-negotiation as defined in Clause 45. Refer to IEEE 802.3 45.2.7.1. This register mirrors register STD_CTRL from Clause 22.

IEEE Standard Register=7.0

ANEG_CTRL

Auto-Negotiation Control (Register 7.0)

Reset Value

3000_H

15	14	13	12	11	10	9	8												0
RST	RES3	XNP	ANEG_EN*		RES2	ANEG_RE*												RES1	
RW	RO	RW	RW		RO	RW												RO	

Field	Bits	Type	Description
RST	15	RW	Reset This bit resets the entire PHY to its default state. Active links are terminated. This is a self-clearing bit. The GPHY firmware sets the bit to 0 via the hardware when the reset is completed. 0 _B NORMAL Normal GPHY operation 1 _B RESET GPHY reset
RES3	14	RO	Reserved Value always 0, writes ignored.
XNP	13	RW	Extended Next Page Control 0 _B ZERO Extended next page is disabled. 1 _B ONE Extended next page is enabled.
ANEG_ENAB	12	RW	Auto-Negotiation Enable This bit enables the ANEG process to determine the link configuration. Bit 7.0.12 is a copy of bit 0.12 in register 0 (STD_CTRL). 0 _B ZERO ANEG process is disabled. 1 _B ONE ANEG process is enabled.
RES2	11:10	RO	Reserved Value always zero, writes ignored.
ANEG_RESTART	9	RW	Restart Auto-Negotiation The ANEG process is restarted by setting bit 7.0.9 to 1. Bit 7.0.9 is a mirror of bit 0.9 in register 0 (STD_CTRL). Completion of ANEG is indicated in bit 0.1.5 and 7.1.5. 0 _B ZERO Normal operation 1 _B RESTART Restarts ANEG process.
RES1	8:0	RO	Reserved Value always 0, writes ignored.

Auto-Negotiation Status (Register 7.1)

All the bits in the ANEG_STA status register are read only and correspond to the outcome or current status of the auto-negotiation process.

IEEE Standard Register=7.1

ANEG_STAT

Auto-Negotiation Status (Register 7.1)

Reset Value

0008_H

15	10	9	8	7	6	5	4	3	2	1	0
RES3		PDF	RES2	XNPS	PR	ANEG_CO*	ANEG_RF	ANEG_AB*	LINKS TA	RES1	LP_A NEG*
ro		ro	ro	ro	ro	ro	rosc	ro	ro	ro	ro

Field	Bits	Type	Description
RES3	15:10	RO	Reserved Value always zero, writes ignored.
PDF	9	RO	Parallel Detection Fault 0 _B NOFAULT No fault detected 1 _B FAULT Fault detected via the parallel mechanism
RES2	8	RO	Reserved Value always 0, writes ignored.
XNPS	7	RO	Extended Next Page Status When set to 1 _B , bit 7.1.7 indicates that both the GPHY and the link partner confirmed support for extended next page. When set to 0 _B , bit 7.1.7 indicates that the extended next page feature is not used. 0 _B ZERO Extended next page is not allowed. 1 _B ONE Extended next page format is used.
PR	6	RO	Page Received The Page Received bit (7.1.6) is set to 1 _B to indicate that a new link codeword was received and stored in the AN LP Base Page ability registers 7.19 or AN LP XNP ability registers 7.25 to 7.27. 0 _B ZERO No page received 1 _B ONE Page received
ANEG_COMPLETE	5	RO	Auto-Negotiation Complete When read as a 1, bit 7.1.5 indicates that the ANEG process was completed and that the contents of the ANEG registers 7.16 and 7.19 are valid. When read as a 0, bit 7.1.5 indicates that the ANEG process was not completed and that the contents of the 7.19, 7.22 through 7.27, and 7.33 registers are as defined by the current state of the ANEG protocol, or as written by manual configuration. 0 _B ZERO ANEG process not completed 1 _B ONE ANEG process completed

Field	Bits	Type	Description (cont'd)
ANEG_RF	4	ROSC	Remote Fault When read as 1, bit 7.1.4 indicates that a remote fault condition was detected. Bit 7.1.4 is a copy of bit 1.4 in register 1, device 0. 0 _B NORMAL No remote fault condition detected 1 _B FAULT Remote fault condition detected
ANEG_ABLE	3	RO	Auto-Negotiation Ability Bit 7.1.3 is a copy of bit 1.3 in register 1. This is the ANEG ability of the GPHY. 0 _B UNABLE PHY is not able to perform ANEG. 1 _B ABLE PHY is able to perform ANEG.
LINKSTA	2	RO	Link Status When read as 1 _B , bit 7.1.2 indicates that the PMA/PMD determined that a valid link is established. This bit is a duplicate of the PMA/PMD link status bit in 1.1.2. This bit latches low so it does not represent the current status, but is used to indicate link drop since the last read from the management interface. Reading this bit from the MDIO resets the bit to the current value of the link. 0 _B DOWN Link is down. 1 _B UP Link is up.
RES1	1	RO	Reserved Value always 0, write ignored.
LP_ANEG_ABLE	0	RO	Link Partner Auto-Negotiation Ability 0 _B UNABLE Link partner is not capable of ANEG. 1 _B ABLE Link partner is capable of ANEG.

6.4.1 VSPEC1 Register Descriptions

This section describes all the VSPEC1 registers in detail.

Configuration for LED Pin 0 (Register 30.1)

This register configures the behavior of the LED0 pin depending on predefined states or events the PHY entered into or raised. Since more than one event/state may be active at the same time, more than one function may apply at the same time. The priority from highest to lowest is given by the order: PULSE, BLINKS, BLINKF, and CON. The LED PULSE for the selected activity is only displayed for the link speed selected in CON. When CON is selected as NONE, no PULSE is displayed on the LED for any activity. To avoid the LED being constantly on when it is configured for pulsing alone, set the NO_CON bit in the PULSE field (bit 11).

IEEE Standard Register=30.1

VSPEC1_LED0

PCH_EN	2	RW	Enable PCH Enable PCH preamble 0 _B DISABLE Disable 1 _B ENABLE Enable
SI	1	RW	Super Isolate Use in Super Isolate mode. Forces the device into a power down state by pin strapping (SLEEP) in which power consumption is the bare minimum required to still maintain the MII management interface communication. When activating the power down functionality, the PHY terminates active data links. The MII interface is also stopped in power down mode. See also IEEE 802.3-2008 22.2.4.1.5. The SI bit is only used to release the device from Super Isolate mode. Entering Super Isolate mode can only be activated by pin strapping at power up. 0 _B NORMAL Normal operational mode 1 _B SUPER_ISOLATE Super Isolate mode
PM_EN	0	RW	Enable Packet Manager This field enables LPI generation within the GPHY. The Packet Manager on the GPHY supports the Smart AZ features. This bit is only applicable for port 0, once this bit in port 0 is set, it will apply to all GPHY ports. Resetting this bit back from 1 to 0 is not supported. 0 _B DISABLE PM is bypassed, transparent mode 1 _B ENABLE SmartAZ mode

Temperature Code (Register 30.14)

Junction temperature is presented in degrees Celsius

IEEE Standard Register=30.14

VSPEC1_TEMP_STA

Reset Value

Temperature Code (Register 30.14)

0000_H

Field	Bits	Type	Description
TEMP_DATA	15:0	RO	Junction Temperature The temperature is represented as a two's complement binary fixed point number, of which the 7 LSBs are fractional. The STA must take the thermal mitigation measures when the junction temperature exceeds the normal operating range if ADS is disabled. TEMP_DATA is invalid when the value is 0000 _H . Example Tj Values (Decimal): <ul style="list-style-type: none"> For Tj = -40 degC, TEMP_DATA = EC00_H For Tj = +125 degC, TEMP_DATA = 3E80_H

This register defines the mask for the Interrupt Status Register (ISTAT), which contains the event source for the MDINT interrupt sent from the GPHY to an external chip. The mask is cleared whenever the corresponding interrupt is serviced.

IEEE Standard Register=30.17

Reset Value

0000_H[illegible]

Field	Bits	Type	Description
CDET	5	RW	Cable Detect Interrupt When active, MDINT is activated upon interrupt from detection of energy on the link. 0 _B INACTIVE Interrupt is masked out. 1 _B ACTIVE Interrupt is activated.
TS_FIFO	3	RW	Time Stamp FIFO Interrupt When active, MDINT is activated upon interrupt from either Tx or Rx Time stamp FIFO. 0 _B INACTIVE Interrupt is masked out. 1 _B ACTIVE Interrupt is activated.
GMACL_TS	0	RW	Status of Interrupt Request GMACL TS When active, MDINT is activated upon GMACL time stamp valid interrupt. 0 _B INACTIVE Interrupt is masked out. 1 _B ACTIVE Interrupt is activated.

IEEE Standard Register=30.18

Reset Value

0000_H[illegible]

Field	Bits	Type	Description
CDET	5	ROSC	Cable Detect Interrupt When this bit is set, MDINT is activated upon interrupt from detection of energy on the link. 0 _B INACTIVE This event is not the interrupt source. 1 _B ACTIVE The cable detect interrupt is the source of the interrupt.
TS_FIFO	3	ROSC	Time Stamp FIFO Interrupt When this bit is set, MDINT is activated upon interrupt from either Tx or Rx time stamp FIFO. 0 _B INACTIVE This event is not the interrupt source. 1 _B ACTIVE The time stamp FIFO interrupt is the source of the interrupt.
GMACL_TS	0	ROSC	Status of Interrupt Request GMACL TS When this bit is set, MDINT is activated upon interrupt from GMACL time stamp valid interrupt. 0 _B INACTIVE This event is not the interrupt source. 1 _B ACTIVE The GMACL time stamp is the source of the interrupt.

This register offers a programmable option to map physical lanes A, B, C, and D of the TPI to the ASPs. Each ASP must be mapped to each lane.

VSPEC1_LANE_ASP_MAP

ASP Mapping to Physical Lanes (Register 30.20)

00E4_H

Field	Bits	Type	Description
LANE_D	7:6	RW	Map Physical Lane-D to the ASP 00 _B ASPA Map Physical Lane-D to the ASP-A 01 _B ASPB Map Physical Lane-D to the ASP-B 10 _B ASPC Map Physical Lane-D to the ASP-C 11 _B ASPD Map Physical Lane-D to the ASP-D
LANE_C	5:4	RW	Map Physical Lane-C to the ASP 00 _B ASPA Map Physical Lane-C to the ASP-A 01 _B ASPB Map Physical Lane-C to the ASP-B 10 _B ASPC Map Physical Lane-C to the ASP-C 11 _B ASPD Map Physical Lane-C to the ASP-D
LANE_B	3:2	RW	Map Physical Lane-B to the ASP 00 _B ASPA Map Physical Lane-B to the ASP-A 01 _B ASPB Map Physical Lane-B to the ASP-B 10 _B ASPC Map Physical Lane-B to the ASP-C 11 _B ASPD Map Physical Lane-B to the ASP-D
LANE_A	1:0	RW	Map Physical Lane-A to the ASP 00 _B ASPA Map Physical Lane-A to the ASP-A 01 _B ASPB Map Physical Lane-A to the ASP-B 10 _B ASPC Map Physical Lane-A to the ASP-C 11 _B ASPD Map Physical Lane-A to the ASP-D

Time to Enter Low Power (Register 30.21)

Programmable option to delay the time taken to enter low power mode.

IEEE Standard Register=30.21

VSPEC1_LOW_POWER_ENTRY_TIME

Reset Value

Time to Enter Low Power (Register 30.21)

0001_H

Field	Bits	Type	Description
LPE_TIM	4:0	RW	Low Power Entry Time This is the time taken from detection of no activity on the line to the low power completion. The granularity is 4 seconds and adds 2.4 seconds to 5.6 seconds on to the initial time.

Fast Retrain Control and Status (Register 30.22)

This register supports fast retrain (FR) as follows:

1. Configures the FR capability (IEEE, CISCO(THPBYP,TXDIS,EXT) [10]).
2. Records the link partner FR capability.
3. Reports the FW resolution of the FR capability.
4. Defines the maximum allowed number of times to try FR before performing a full link down.

IEEE Standard Register=30.22

6.5 Vendor Specific 2 Device Registers

This register file contains the GPHY-specific registers for MMD=31 (decimal).

Table 35 Registers Overview- Vendor Specific 2 Device Registers

Register Short Name	Register Long Name	Reset Value
VPSPEC2_WOL_CTL	WoL Control Register (Register 31.3590)	0000 _H
VPSPEC2_WOL_AD01	WoL Address Byte 0 and 1 (Register 31.3592)	0000 _H
VPSPEC2_WOL_AD23	WoL Address Byte 2 and 3 (Register 31.3593)	0000 _H
VPSPEC2_WOL_AD45	WoL Address Byte 4 and 5 (Register 31.3594)	0000 _H
VPSPEC2_WOL_PW01	WoL SecureON Password Byte 0 (Register 31.3595)	0000 _H
VPSPEC2_WOL_PW23	WoL SecureON Password Byte 2 and 3 (Register 31.3596)	0000 _H
VPSPEC2_WOL_PW45	WoL SecureON Password Byte 4 and 5 (Register 31.3597)	0000 _H

Wake-on-LAN Address Byte 0 and 1 (Register 31.3592)

Wake-on-LAN Address Byte 0 and 1. Redirected to PCS_PDI_WOL_AD01.

IEEE Standard Register=31.3592

VPSPEC2_WOL_AD01

Reset Value

Wake-on-LAN Address Byte 0 and 1 (Register 31.3592)

0000_H

Field	Bits	Type	Description
AD1	15:8	RW	Address Byte 1 Defines byte 1 of the WoL-designated MAC address to which the PHY is sensitive.
AD0	7:0	RW	Address Byte 0 Defines byte 0 of the WoL-designated MAC address to which the PHY is sensitive.

Wake-on-LAN Address Byte 2 and 3 (Register 31.3593)

Wake-on-LAN Address Byte 2 and 3. Redirected to PCS_PDI_WOL_AD23.

IEEE Standard Register=31.3593

VPSPEC2_WOL_AD23

Reset Value

Wake-on-LAN Address Byte 2 and 3 (Register 31.3593)

0000_H

Field	Bits	Type	Description
AD3	15:8	RW	Address Byte 3 Defines byte 3 of the WoL-designated MAC address to which the PHY is sensitive.
AD2	7:0	RW	Address Byte 2 Defines byte 2 of the WoL-designated MAC address to which the PHY is sensitive.

Wake-on-LAN Address Byte 4 and 5 (Register 31.3594)

Wake-on-LAN Address Byte 4 and 5. Redirected to PCS_PDI_WOL_AD45.

IEEE Standard Register=31.3594

VPSPEC2_WOL_AD45

Reset Value

Wake-on-LAN Address Byte 4 and 5 (Register 31.3594)

0000_H

Field	Bits	Type	Description
AD5	15:8	RW	Address Byte 5 Defines byte 5 of the WoL-designated MAC address to which the PHY is sensitive.
AD4	7:0	RW	Address Byte 4 Defines byte 4 of the WoL-designated MAC address to which the PHY is sensitive.

Wake-on-LAN SecureON Password Byte 0 (Register 31.3595)

Wake-on-LAN SecureON Password Byte 0. Redirected to PCS_PDI_WOL_PWD01.

IEEE Standard Register=31.3595

VPSPEC2_WOL_PW01

Reset Value

Wake-on-LAN SecureON Password Byte 0 (Register 31.3595)

0000_H

Field	Bits	Type	Description
PW1	15:8	RW	SecureON Password Byte 1 Defines byte 1 of the WoL-designated SecureON password to which the PHY is sensitive.
PW0	7:0	RW	SecureON Password Byte 0 Defines byte 0 of the WoL-designated SecureON password to which the PHY is sensitive.

Wake-on-LAN SecureON Password Byte 2 and 3 (Register 31.3596)

Wake-on-LAN SecureON Password Byte 2 and 3. Redirected to PCS_PDI_WOL_PWD23.

IEEE Standard Register=31.3596

VPSPEC2_WOL_PW23

Reset Value

Wake-on-LAN SecureON Password Byte 2 and 3 (Register 31.3596)

0000_H

Field	Bits	Type	Description
PW3	15:8	RW	SecureON Password Byte 3 Defines byte 3 of the WoL-designated SecureON password to which the PHY is sensitive.
PW2	7:0	RW	SecureON Password Byte 2 Defines byte 2 of the WoL-designated SecureON password to which the PHY is sensitive.

Wake-on-LAN SecureON Password Byte 4 and 5 (Register 31.3597)

Wake-on-LAN SecureON Password Byte 4 and 5. Redirected to PCS_PDI_WOL_PWD45.

IEEE Standard Register=31.3597

VPSPEC2_WOL_PW45

Reset Value

Wake-on-LAN SecureON Password Byte 4 and 5 (Register 31.3597)

0000_H

Field	Bits	Type	Description
PW5	15:8	RW	SecureON Password Byte 5 Defines byte 5 of the WoL-designated SecureON password to which the PHY is sensitive.
PW4	7:0	RW	SecureON Password Byte 4 Defines byte 4 of the WoL-designated SecureON password to which the PHY is sensitive.

7 Electrical Characteristics

This chapter provides the electrical characteristics for the MxL86289I.

7.1 Absolute Maximum Ratings

Table 36 shows the absolute maximum ratings for the MxL86289I.

Table 36 Absolute Maximum Ratings

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Storage Temperature Limits	T_{STG}	-55.0	—	125.0	°C	—
Soldering Temperature	T_{SOL}	—	—	260.0	°C	Compliance with lead free re-flow soldering profile as J-STD-020D
Moisture Level 3 Temperature Limits	T_{ML3}	—	—	260.0	°C	According to IPS J-STD 020
Absolute Junction Temperature	T_{JABS}	-40.0		125	°C	The thermal solution must ensure that T_J never exceeds T_{JABS} maximum. The chip resets the device when $T_J > T_{JABS}$ maximum to prevent any damage to occur.
DC Voltage Limits on VDD3V3PAD1, VDD3V3PAD2 Pins	V_{DDP3V3}	-0.5	—	+3.63	V	Generic ball V_{HIGH} supply
DC Voltage Limits on VDDP_PAD Pins when Ball K3 Pin Strap PS_MDIO_VOLTAGE is HIGH	V_{DDP}	-0.5	—	+3.63	V	Multi voltage ball V_{HIGH} supply
DC Voltage Limits on VDDP_PAD Pins when Ball K3 Pin Strap PS_MDIO_VOLTAGE is LOW	V_{DDP}	-0.5	—	+1.98	V	Multi voltage ball supply. 1.8 V supply dedicated to MDIO pins in lower mode
DC Voltage Limits on VDDA3V3_0, VDDA3V3_1, VDDA3V3_2, VDDA3V3_3, VDDA3V3_4, VDDA3V3_5, VDDA3V3_6, and VDDA3V3_7 Pins	V_{DDA3V3}	-0.5	—	+3.63	V	Chip analog V_{HIGH} supply
DC Voltage Limits on VDDA1V8_0, VDDA1V8_1 Pins	V_{DDA1V8}	-0.5	—	+1.98	V	Chip analog supply

Electrical Characteristics
Table 36 Absolute Maximum Ratings (cont'd)

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
DC Voltage Limits on VDDA1V8PORXO, VDDA1V8_PVT, VCC1V8_OTP Pins	$V_{\text{DDA1V8PORXO}}$ $V_{\text{DDA1V8PVT}}$ V_{CC1V8OTP}	-0.5	—	+1.98	V	Chip clocking supply
DC Voltage Limits on VPHA1V8_0, VPHA1V8_1, and VDDA1V8_PLL Pins	V_{PH} $V_{\text{DDA1V8PLL}}$	-0.5	—	+1.98	V	USXGMII, LJ PLL V_{HIGH} supply
DC Voltage Limits on VDDA1V2CDB0, VDDA1V2CDB1 Pins	$V_{\text{DDA1V2CDB}}$	-0.5	—	+1.32	V	Chip analog supply
DC Voltage Limits on VDDA0V8_0, VDDA0V8_1, VDDD0V8REF, VDDD0V8POST Pins	V_{DDA0V8} $V_{\text{DDD0V8PLL}}$	-0.5	—	+0.89	V	Chip analog V_{LOW} supply, LJ PLL V_{LOW} supply
DC Voltage Limits on VDDD0V8_COR Pins	V_{DD}	-0.5	—	+0.89	V	Chip core supply
DC Voltage Limits on VA0V8_0, VA0V8_1 Pins	V_{P}	-0.5	—	+0.89	V	USXGMII V_{LOW} supply
DC Voltage Limits on Any Other Pins ¹⁾ with Respect to Ground	V_{DC}	-0.5	—	$V_{\text{DDP3V3}} + 0.5$	V	Unless specified otherwise
XTAL1 Input Voltage	V_{XTAL1}	-0.30	—	2.0	V	—
ESD HBM Robustness	$V_{\text{ESD,HBM}}$	—	—	1000.0	V	According to ANSI/ESDA/JEDEC JS-001-2014
ESD CDM Robustness	$V_{\text{ESD,CDM}}$	—	—	250.0	V	According to ANSI/ESDA/JEDEC JS-002-2014

1) Any pin that is not a supply pin out of one of the domains: V_{DDP} , V_{PH} , V_{P} , V_{DDA3V3} , $V_{\text{DDA1V8PORXO}}$, $V_{\text{DDA1V2CDB}}$, V_{DDA0V8} , V_{DD} , and V_{DDA1V8} .

Attention: Stresses above the maximum values listed in this table may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the device.

Electrical Characteristics

7.2 Operating Range

Table 37 defines the limit values of voltages and temperature which may be applied to guarantee proper operation of the MxL86289I.

Table 37 Operating Range

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Ambient Temperature under Bias	T_A	-40.0	–	85.0	°C	The thermal design must ensure that the maximum junction temperature is not exceeded. The use of a heat sink may be suitable.
Junction Temperature	T_j	–	–	110.0	°C	Thermal solution must ensure that T_j remains within operating range and never exceeds maximum absolute ratings (T_{JABS}).
Generic Pin Supply Voltage	V_{DDP3V3}	3.14	3.30	3.46	V	Generic pin V_{HIGH} supply
Multi Voltage Pin Supply Voltage for MDIO Signals when Ball K3 Pin Strap PS_MDIO_VOLTAGE is HIGH	V_{DDP}	3.14	3.30	3.46	V	Multi voltage pin V_{HIGH} supply
Multi Voltage Pin Supply Voltage for MDIO Signals when Ball K3 Pin Strap PS_MDIO_VOLTAGE is LOW	V_{DDP}	1.71	1.80	1.89	V	Multi voltage pin supply. 1.8 V supply dedicated to MDIO pins in lower mode
Analog High Supply Voltage	V_{DDA3V3}	3.14	3.30	3.46	V	Chip analog V_{HIGH} supply
XO Supply Voltage	$V_{DDA1V8POR}$ XO	1.71	1.80	1.89	V	Chip clocking V_{HIGH} supply
Analog Medium Supply Voltage	V_{DDA1V8}	1.71	1.80	1.89	V	Chip analog V_{MED} supply
CDB Supply Voltage	$V_{DDA1V2CDB}$	1.14	1.20	1.26	V	Chip analog supply
USXGMII High Supply Voltage	V_{PH}	1.71	1.80	1.89	V	USXGMII V_{HIGH} supply
LJ PLL High Supply Voltage	$V_{DDA1V8PLL}$	1.71	1.80	1.89	V	LJ PLL V_{HIGH} supply
Analog Low Supply Voltage	V_{DDA0V8}	0.81	0.85	0.89	V	Chip analog V_{LOW} supply
LJ PLL Low Supply Voltage	$V_{DDD0V8PLL}$	0.81	0.85	0.89	V	LJ PLL V_{LOW} supply
Chip Core Supply Voltage	V_{DD}	0.81	0.85	0.89	V	Chip core supply
USXGMII Low Supply Voltage	V_P	0.81	0.85	0.89	V	USXGMII V_{LOW} supply
Ground	V_{SS}	0.00	0.00	0.00	V	–

Attention: Operations above the maximum values listed here for extended periods may adversely affect long-term reliability of the device.

7.3 Typical Power Consumption

Table 38 lists the typical power consumption for different modes. Typical power is the power consumed by a nominal process device, nominal supply voltages, at 25°C ambient temperature and a CAT5e link segment.

The conditions for Link-up are full speed and bidirectional, full duplex traffic on all 8 ports. There are 10G links on both SerDes interfaces.

Table 38 Typical Power Consumption

	3.3 V V_{HIGH} Domain Current	1.8 V Domain Current	1.2 V Domain Current	0.85 V V_{LOW} Domain Current	0.85 V V_P Domain Current	Chip Power
Unit	mA	mA	mA	mA	mA	W
2500BASE-T Link-up, 100 m Cable	393	138	470	3453	128	5.2
2500BASE-T Link-up, 30 m Cable	372	136	450	2930	127	4.6
2500BASE-T EEE	313	124	138	1592	124	2.9
1000BASE-T Link-up, 100 m Cable	306	136	435	1489	124	3.1
1000BASE-T EEE	47	126	123	895	126	1.4
100BASE-TX Link-up, 100 m Cable	91	124	111	694	122	1.4
100BASE-TX EEE	60	148	120	646	124	1.1
10BASE-Te Link-up, 100 m Cable	89	127	66	616	117	1.2
Cable Unplugged - ANEG	40	127	66	635	123	1.1
Cable Unplugged - Low Power	23	121	4	338	123	0.7
Reset	3	25	0	64	3	0.1

7.4 Maximum Thermal Design Power

Table 39 lists the maximum Thermal Design Power (TDP). The TDP is the power consumption for a full traffic load and worst-case process, supply voltage, cable, and temperature conditions. This value is relevant to design the thermal solution.

Table 39 Maximum Power Consumption

Condition	Maximum Power (W)
Maximum Chip Power at Maximum Operating Range	7.3

Note: With a properly designed thermal solution (heat sink), it is unlikely that T_j exceeds the maximum operating junction temperature. An excess is reported in the MDIO register VSPEC1_TEMP_STA and the STA can initiate a renegotiation to a lower link rate to get T_j back into the operating temperature range if ADS is disabled.

7.5 Maximum Current

Table 40 provides the maximum current to dimension the power supply. It is the maximum current consumption per rail for a full traffic load and worst-case process, supply voltage and temperature conditions that may occur in any operating state of the device. The maximum current can be higher than the steady state current, for instance in training phases of the internal filters.

Electrical Characteristics

Table 40 Maximum Current Per Rail

3.3 V Domain Current	1.8 V Domain Current	1.2 V Domain Current	0.85 V V _{LOW} Domain Current	0.85 V V _P Domain Current
mA	mA	mA	mA	mA
477	154	587	6000	203

7.6 DC Characteristics

These sections document the DC characteristics of the MxL86289I external interfaces.

7.6.1 Digital Interfaces

This section defines the DC characteristics of the GPIO interface as follows:

- General Purpose IO
- MDIO
- QSPI
- UART
- I²C
- Interrupts
- Clock Input and Outputs
- LED
- JTAG
- HRSTN

Table 41 summarizes the DC characteristics for $V_{DDP} = 3.3\text{ V}$.

Table 41 DC Characteristics of the GPIO Interfaces ($V_{DDP} = 3.3\text{ V}$)

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Input High Voltage	V_{IH}	$0.7 \cdot V_{DDP}$	–	$V_{DDP} + 0.3$	V	–
Input Low Voltage	V_{IL}	–0.3	–	$0.3 \cdot V_{DDP}$	V	–
Output High Voltage	V_{OH}	$V_{DDP} - 0.4$	–	–	V	$I_{OH} = 2, 4, 8, 12\text{ mA}$
Output Low Voltage	V_{OL}	–	–	0.4	V	$I_{OL} = 2, 4, 8, 12\text{ mA}$

Table 42 summarizes the DC characteristics for $V_{DDP} = 1.8\text{ V}$.

Table 42 DC Characteristics of the GPIO Interfaces ($V_{DDP} = 1.8\text{ V}^{1)}$)

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Input High Voltage	V_{IH}	$0.65 \cdot V_{DDP}$	–	$V_{DDP} + 0.3$	V	–
Input Low Voltage	V_{IL}	–0.3	–	$0.35 \cdot V_{DDP}$	V	–
Output High Voltage	V_{OH}	$V_{DDP} - 0.4$	–	–	V	$I_{OH} = 2, 4, 8, 12\text{ mA}$
Output Low Voltage	V_{OL}	–	–	0.4	V	$I_{OL} = 2, 4, 8, 12\text{ mA}$

1) 1.8V is only applicable to the pins specified in **PS_MDIO_VOLTAGE** of **Table 17**.

7.6.2 Twisted Pair Interface

The TPI conforms to the specifications of 10BASE-Te (Clause 14), 100BASE-TX (Clause 25), 1000BASE-T (Clause 40), and 2.5GBASE-T (Clause 126) given in IEEE 802.3, and ANSI X3.263-1995.

7.6.3 Built-in Temperature Sensor

Table 43 provides the parameters of the integrated temperature sensor.

Table 43 Temperature Sensor Characteristics

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Temperature Range	T _{range}	-40		125	°C	The thermal mitigation measures must ensure that T _j remains within the operating range. When T _j exceeds the maximum ratings, the device performs a self-reset to prevent damage.
Resolution		–	12	–	bits	–
Accuracy		-3	–	+3	°C	Without calibration

7.7 AC Characteristics

The AC characteristics of the external interfaces are specified under these operating conditions:

$$T_A = -40 \text{ to } 85^\circ\text{C}$$

$$V_{DDP} = 3.3 \text{ V} \pm 5\%$$

$$V_{SS} = 0 \text{ V}$$

The timing measurements are made at minimum V_{IH} for a logical 1 and at maximum V_{IL} for a logical 0. See [Table 41](#) and [Table 42](#) for more details.

[Figure 17](#) shows the AC testing input/output waveforms. The load capacitors are according to the specific interface standard. All non-specified interfaces use 30 pF as assumed loading.

Figure 17 Input/Output Waveform for AC Tests

7.7.1 Power Up Sequence

All V_{HIGH} , V_{PH} , V_{DDA} , V_P , and V_{LOW} are supplied externally.

In this section, for the sake of simplicity:

- All 3.3 V supplies are represented as V_{HIGH} .
- All 1.8 V supplies are represented as V_{PH} .
- All 1.2 V supplies are represented as V_{DDA} .
- The 0.85 V analog supply of SerDes is represented as V_P .
- The rest of the 0.85 V supplies are represented as V_{LOW} .

All the supply domains V_{HIGH} , V_{PH} , V_{DDA} , V_P , and V_{LOW} , and the input reference clock must be stabilized before releasing the reset HRSTN.

There is no known voltage rail power up sequence except that V_{HIGH} must be ramped up and stable before V_{PH} is ramped up, V_{LOW} must be ramped up and stable before V_P is ramped up, and V_{LOW} must be ramped up and stable before V_{PH} is ramped up. MaxLinear recommends implementing the power-up sequence defined in the reference board. Refer to the relevant hardware documentation available at <https://maxlinear.com/myMxL> for more information on the power circuitry.

The MxL86289I supports an asynchronous hardware reset HRSTN. [Table 44](#) lists the timing requirements of the power supply pins. The timings refer to the signal sequence waveforms depicted in [Figure 18](#).

When PS_MDIO_VOLTAGE is low, V_{DDP} is treated as V_{PH} .

When PS_MDIO_VOLTAGE is high, V_{DDP} is treated as V_{HIGH} .

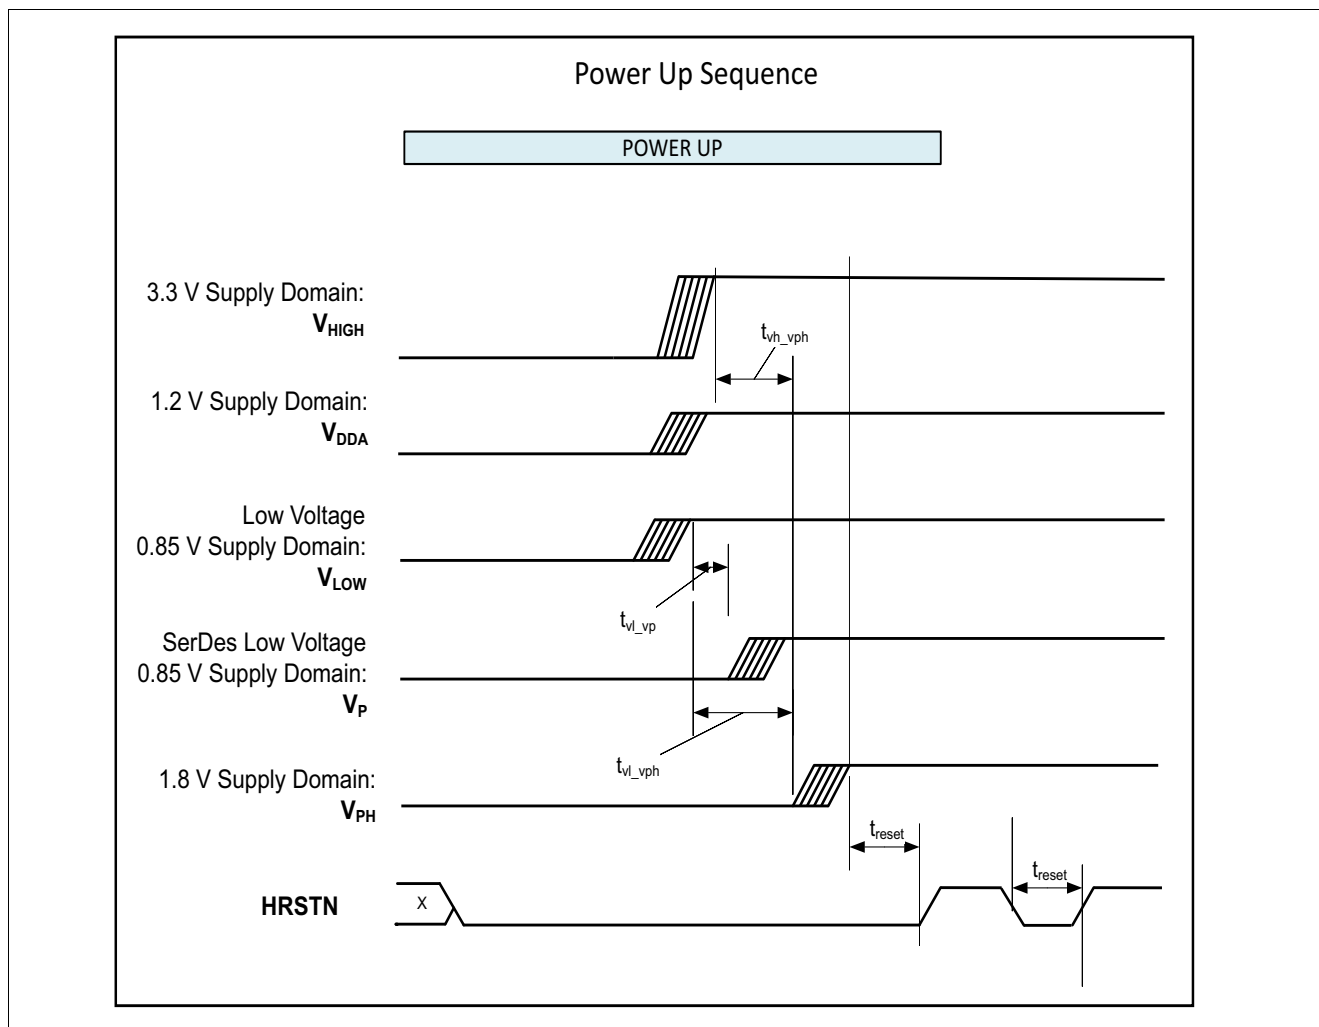

Figure 18 Timing Diagram for the Reset Sequence

Table 44 Power Supply Timings

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Delay between V_{HIGH} and V_{PH} Domains Voltage Ramp Up	t_{vh_vph}	50	-	-	μs	The V_{PH} voltage must never be higher than V_{HIGH} voltage
Delay between V_{LOW} and V_P Domains Voltage Ramp Up	t_{vl_vp}	1	-	-	μs	The V_P voltage must never power up before V_{LOW} voltage.
Delay between V_{LOW} and V_{PH} Domains Voltage Ramp Up	t_{vl_vph}	50	-	-	μs	The V_{PH} voltage must never power up before V_{LOW} voltage.
Reset Time after all Voltage Domains are Stabilized	t_{reset}	100	-	-	ns	HRSTN must be released after the power supplies stabilized.

7.7.2 Input Clock

Table 45 lists the input clock requirements when not using a crystal, for example when an external reference clock is injected into the XTAL1 pin of the MxL86289I, such as nominal frequency, frequency deviation, duty cycle, and signal characteristics. When a crystal is applied to generate the reference clock using the integrated XO, the clock requirements stated here are explicitly met as long as the specification for the crystal is satisfied.

Table 45 AC Characteristics of Input Clock on XTAL1 Pin

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Frequency with 25 MHz Input	f_{clk25}	—	25.0	—	MHz	—
Frequency with 50 MHz Input	f_{clk50}	—	50.0	—	MHz	—
Frequency with 156.25 MHz Input	f_{clk156}	—	156.25	—	MHz	—
Frequency Deviation ¹⁾		-50.0	—	+50.0	ppm	—
Duty Cycle		40.0	50.0	60.0	%	—
Rise/Fall Times with 25 MHz Input		—	—	10.0	ns	25 MHz
Rise/Fall Times with 50 MHz Input		—	—	5.0	ns	50 MHz
Rise/Fall Times with 156.25 MHz Input		—	—	1.0	ns	156.25 MHz
Input Long Term Jitter (Jrms)		—	—	2.0	ps	1 kHz to 10 MHz
Input Voltage Swing		300.0	—	—	mV	Peak to Peak value
Input Voltage		0	—	1.8	V	—

1) Including the frequency stability tolerance due to temperature, and aging effects over the product lifetime.

7.7.3 Power Supply Rail Requirements

Table 46 lists the required characteristics of the power supplies. The definitions of the power supply rails are the same as that described in [Section 7.7.1](#).

Table 46 AC Characteristics of the Power Supply

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Power Supply Ripple on V_P	R_{VP}	—	—	40.0	mV	Peak to Peak value See Figure 19 .
Power Supply Ripple on V_{LOW}	R_{VLOW}	—	—	40.0	mV	Peak to Peak value
Power Supply Ripple on V_{DDA}	R_{VDDA}	—	—	50.0	mV	Peak to Peak value
Power Supply Ripple on V_{HIGH}	R_{VHIGH}	—	—	50.0	mV	Peak to Peak value
Power Supply Ripple on V_{PH}	R_{VPH}	—	—	50.0	mV	Peak to Peak value Max. 18 mV peak to peak for any noise in 200 kHz to 100 MHz range. See Figure 20 .

7.7.3.1 V_P AC and DC Power Supply Recommendations

This section contains the V_P supply power requirements.

Figure 19 DC and AC Characteristics for V_P Supply

DC Characteristics

- Operating range: See the range of V_P in [Table 37](#)
- Frequency range: 0 to 100 kHz
- Recommendations:
 - The overshoot or undershoot of the low-frequency supply caused by the board filter network should be lower than 100 kHz.
 - The overall DC budget should account for the low frequency overshoot/undershoot in addition to the board plus package IR drop.
 - There is a transition zone between 10 kHz and 100 kHz in which it is possible for the supply noise to increase as the frequency decreases at a rate of 20 dB/Dec up to the maximum of the operating range.

AC Characteristics

- Max 5% (peak-to-peak) of the DC level for all noise greater than 100 kHz
- Recommendations:
 - A switching supply can be used until the overall noise limits (including, the self noise) are met.

7.7.3.2 V_{PH} AC and DC Power Supply Recommendations

This section contains the V_{PH} supply power requirements.

Figure 20 DC and AC Characteristics for V_{PH} Supply

DC Characteristics

- Operating range: See the range of V_{PH} in [Table 37](#)
- Frequency range: 0 to 100 kHz
- Recommendations:
 - The overshoot or undershoot of the low-frequency supply caused by the board filter network should be lower than 100 kHz.
 - The overall DC budget should account for the low frequency overshoot/undershoot in addition to the board plus package IR drop.
 - There is a transition zone between 10 kHz and 100 kHz in which it is possible for the supply noise to increase as the frequency decreases at a rate of 20 dB/Dec up to the maximum of the operating range.

AC Characteristics

- 100 kHz to 200 kHz: A maximum value of 3% ripple (peak-to-peak) of the DC level is allowed for all noise in this region.
- 200 kHz to 100 MHz: A maximum value of 1% ripple (peak-to-peak) of the DC level is allowed in this region.
- 100 MHz and above: A maximum value of 3% ripple (peak-to-peak) of the DC level is allowed for all noise in this region.
- Recommendations:
 - Use an LDO as a switching supply.
 - When using a switching power supply for V_{PH} , ensure that the 200 kHz to 100 MHz ripple requirements are met. Switching power supplies' tone and harmonics typically occur in this region.
 - Do not share this power rail directly with any other noisy circuitry.
 - Follow the relevant hardware documentation available at <https://maxlinear.com/myMxL> on the power circuitry.

7.7.4 MDIO Slave Interface

Figure 21 shows a timing diagram of the MDIO slave interface for a clock cycle in the read, write, and turnaround mode, respectively. The timing measures are annotated. **Table 47** summarizes the defined absolute values.

Figure 21 Timing Diagram for the MDIO Slave Interface

Table 47 Timing Characteristics of the MDIO Slave Interface

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
MDC High Time	t_{CH}	10.0	—	—	ns	The MDC signal must conform to the specified MDC timings when measured at the MxL86289I's MDC_S pin.
MDC Low Time	t_{CL}	10.0	—	—	ns	
MDC Clock Period	t_{CP}	40.0	400.0	—	ns	
MDC Clock Frequency ¹⁾	t_{CP}	—	2.5	25.0	MHz	
MDC Rise Time	t_R	—	—	5.0	ns	
MDC Fall Time	t_F	—	—	5.0	ns	
MDIO Input Setup Time Subject to \uparrow MDC	t_S	10.0	—	—	ns	MxL86289I Receive
MDIO Input Hold Time Subject to \uparrow MDC	t_H	10.0	—	—	ns	MxL86289I Receive
MDIO Output Delay Time Subject to \uparrow MDC	t_D	0.0	—	10	ns	MxL86289I Transmit
Standard at 2.5 MHz						
MDIO Output Delay Subject to \uparrow MDC	t_D	0.0	—	300.0	ns	PHY Transmit

1) The MDC clock supports a range of frequencies up to 25 MHz. The default/typical frequency is 2.5 MHz.

7.7.5 Quad Serial Peripheral Interface (QSPI)

Figure 22 shows the QSPI master timing.

Figure 22 QSPI Master Interface Timing

Table 48 QSPI Interface Timing Parameters

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Master Mode						
TX Data Output Hold	T_{oh}	5%	—	—	Tclk	For Tclk = 20 ns
Tx Data Output Delay	T_{ov}	0	—	50%	Tclk	For Tclk = 20 ns
Rx Data Input Setup time	T_{is}	35%	—	—	Tclk	For Tclk = 20 ns
Rx Data Hold Time	T_{ih}	5%	—	—	Tclk	For Tclk = 20 ns
SPI Clock Period (Master Mode)	T_{clk}	9.846	—	—	ns	Maximum 101.5625 MHz
SPI Clock Rising	S_7	0.1	—	—	V/ns	—
SPI Clock Falling	S_6	0.1	—	—	V/ns	—

7.7.6 I²C Interface

Figure 23 shows the I²C interface timing.

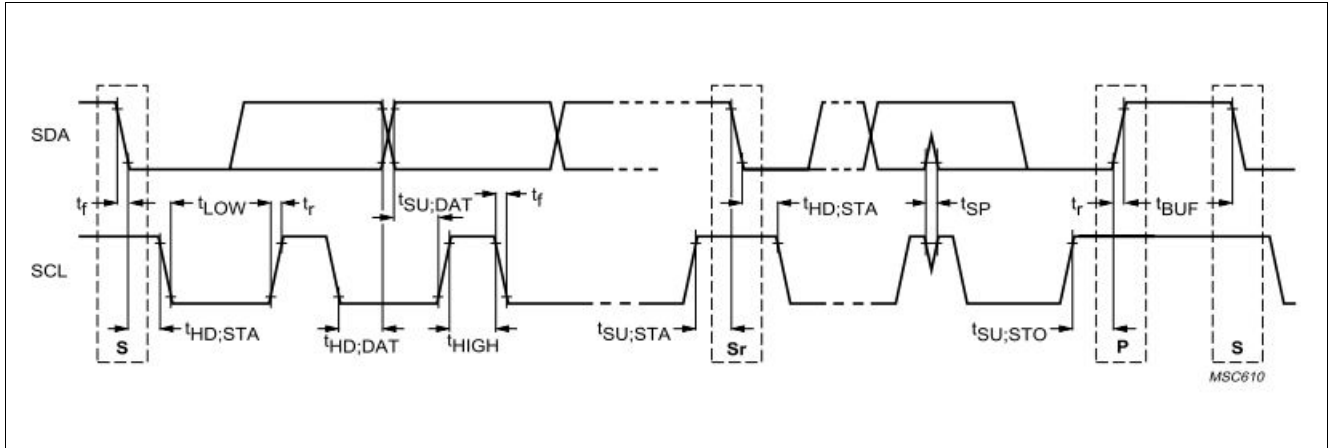

Figure 23 I²C Timing

Table 49 describes the timing values.

Table 49 I²C Timing

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
SCL Frequency	f_{SCL}	0	—	100	kHz	—
Setup Time Data to Shift Clock	$t_{SU,DAT}$	250	—	—	ns	—
Hold Time Data to Shift Clock	$t_{HD,DAT}$	0	—	3.45	μs	—
Setup Time START to Shift Clock	$t_{SU,STA}$	4700	—	—	ns	—
Hold Time START, STOP to Shift Clock	$t_{HD,STA/STO}$	4.0	—	—	μs	—
Low Time	t_{LOW}	4700	—	—	ns	—
High Time	t_{HIGH}	4000	—	—	ns	—
Rising Time	t_r	—	—	1000	ns	—
Falling Time	t_f	—	—	300	ns	—
Bus Free Time	t_{BUF}	4700	—	—	ns	—

7.7.7 JTAG Interface

The JTAG test interface is used for debugging the CPU and boundary scan.

Figure 24 Test Interface Timing

Table 50 and Table 51 describe the timing values for the test interface.

Table 50 Test Interface Clock

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
TCK Clock Period	t_C	100	—	—	ns	—
TCK High Time	t_{CH}	40	—	—	ns	—
TCK Low Time	t_{CL}	40	—	—	ns	—

Table 51 JTAG Timing

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
TMS Setup Time	t_{MS}	40	—	—	ns	—
TMS Hold Time	t_{MH}	40	—	—	ns	—
TDI Setup Time	t_{DS}	40	—	—	ns	—
TDI Hold Time	t_{DH}	40	—	—	ns	—
Hold: TRSTN After TCK	t_{HD}	10	—	—	ns	—
TDO Valid Delay	t_{DV}	—	—	60	ns	—

7.7.8 USXGMII Interface Characteristics

This section describes the AC characteristics of the USXGMII interface on the MxL86289I.

The USXGMII interface characteristics are described in:

- USXGMII transmit characteristics ([Section 7.7.8.1](#))
- USXGMII receive characteristics ([Section 7.7.8.2](#))

7.7.8.1 USXGMII Transmit Characteristics

[Table 52](#) shows the requirements of the USXGMII interface on the MxL86289I.

Table 52 Transmit Characteristics of the USXGMII

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Reference Differential Impedance	Z_d	—	100	—	Ω	—
Termination Mismatch	R_M	—	—	5	%	—
DC Common Mode Voltage	V_{cm}	0	—	3.6	V	—
Output Rise and Fall Time	t_{RH}, t_{FH}	24	—	—	ps	20%→80%
Output AC Common Mode Voltage	—	—	—	15	mV	mV (RMS)
Differential Output Return Loss ¹⁾	SDD22	20	—	—	dB	0.05-0.1 GHz
		10	—	—	dB	0.1-7.5 GHz
		—	—	—		7.5-15 GHz
Common Mode Output Return Loss ²⁾	SCC22	6	—	—	dB	0.1-15 GHz

1) Return loss given by equation $SDD22(dB) = 10 - 16.6 \log_{10}(f/7.5)$, with f in GHz.

2) Common mode reference impedance is 25 Ω common mode return loss helps absorb reflections and noise for EMI.

7.7.8.2 USXGMII Receive Characteristics

[Table 53](#) shows the requirements of the USXGMII interface on the MxL86289I.

Table 53 Receive Characteristics of the USXGMII

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Reference Differential Impedance	Z_d	—	100	—	Ω	—
Termination Mismatch	Z_M	—	—	5	%	—
AC Common Mode Voltage	—	—	—	25	mV	mV (RMS)
Differential Output Return Loss ¹⁾	SDD11	20	—	—	dB	0.05-0.1 GHz
		10	—	—	dB	0.1-7.5 GHz
		—	—	—		7.5-15 GHz
Common Mode Input Return Loss ²⁾	SCC11	6	—	—	dB	0.1-15 GHz
Differential to Common Mode Input Conversion ²⁾	SCD11	12	—	—	dB	0.1-15 GHz

1) Return loss given by equation $SDD11(dB) = 10 - 16.6 \log_{10}(f/7.5)$, with f in GHz.

2) Common mode reference impedance is 25 Ω . SCD11 relates to conversion of differential to common mode and the associated generation of EMI.

7.7.9 Crystal Specification

The 25 MHz crystal must follow the specification given in [Table 54](#).

Table 54 Specification of the Crystal

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Frequency with 25 MHz Input	f_{clk25}	–	25.0	–	MHz	–
Total Frequency Stability	–	-50	–	+50	ppm	Refers to the sum of all effects: such as general tolerance, aging, and temperature dependency
Series Resonant Resistance	–	–	–	40	Ω	–
Drive Level	–	–	0.1	0.2	mW	–
Load Capacitance	C_L	16	–	26	pF	–
Shunt Capacitance	C_0	–	–	7	pF	–

7.8 External Circuitry

This section specifies the component characteristics of the external circuitry connected to the TPIs of the MxL86289I.

7.8.1 Twisted-Pair Common-Mode Rejection and Termination Circuitry

Figure 25 shows the external circuitry necessary to properly terminate the common mode of the TPI.

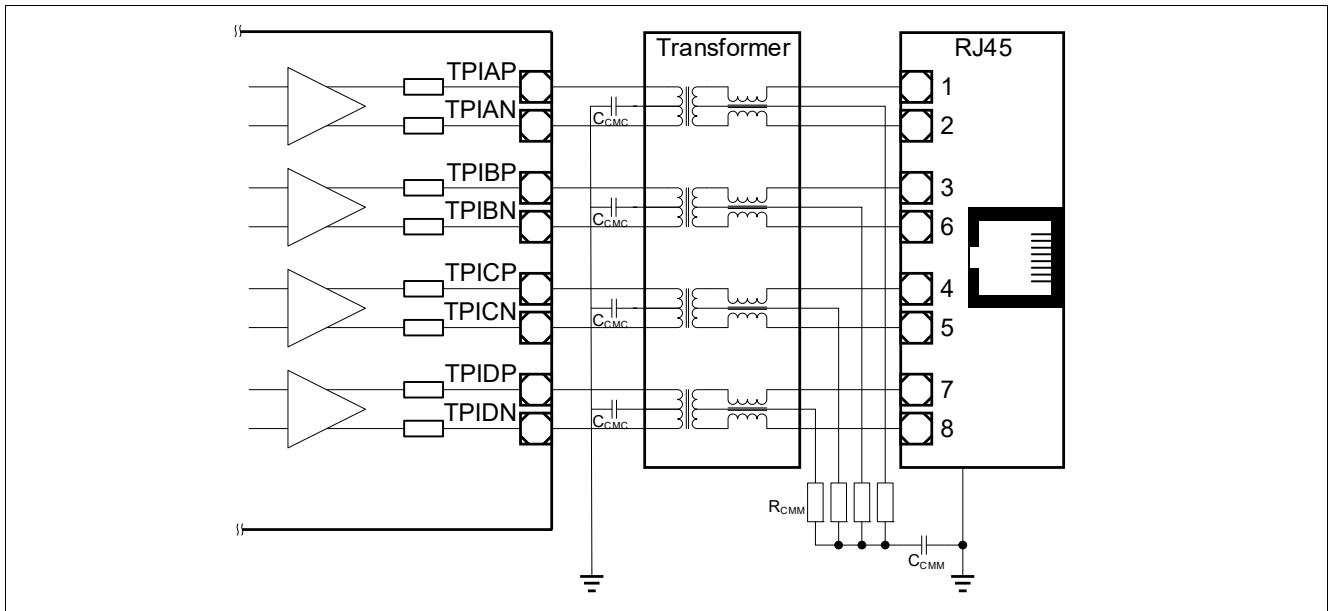

Figure 25 Twisted Pair Common-Mode Rejection and Termination Circuitry

Table 55 defines the component values and their supported tolerances.

Table 55 Electrical Characteristics for Common-Mode Rejection and Termination Circuitry

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Common-Mode Decoupling Capacitance (Media End)	C_{CMM}	800	1000	1200	pF	±15%, 3 kV
Common-Mode Decoupling Capacitance (Chip End)	C_{CMC}	80	100	120	nF	±15%, 25 V
Common-Mode Termination Resistance (Media End)	R_{CMM}	67.5	75	82.5	Ω	±5%

7.8.2 Transformer (Magnetics)

This section specifies the required electrical characteristics of the transformer¹⁾ devices that are supported. The specifications listed here guarantee proper operation according to IEEE 802.3 [2].

Figure 26 depicts a typical Gigabit Ethernet capable transformer device.

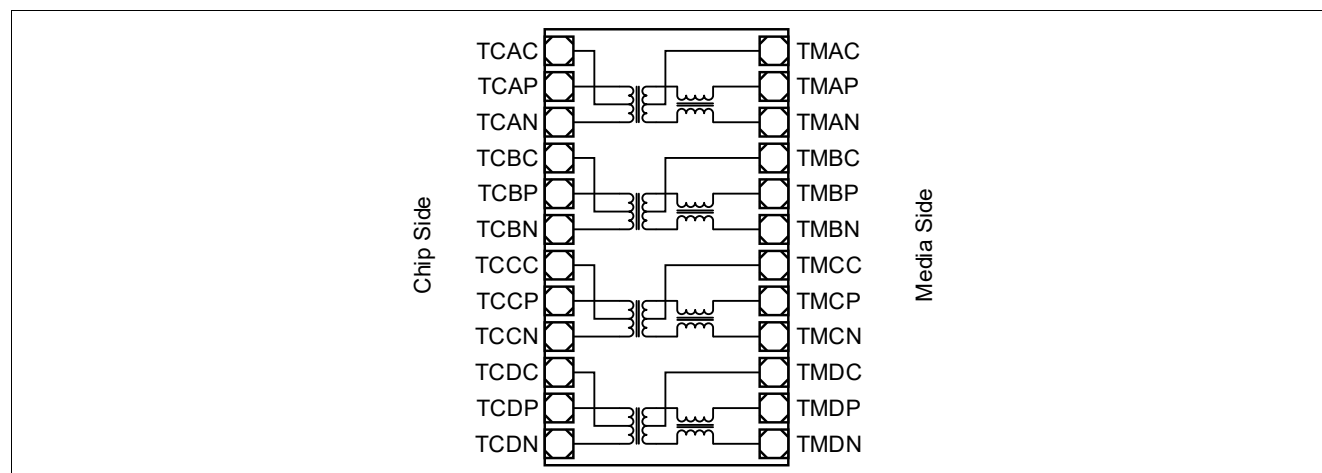

Figure 26 Schematic of an Ethernet Transformer Device

Table 56 lists the characteristics of the supported transformer devices. These characteristics represent the minimum values for achieving standard performance. Since the transformer significantly impacts the link performance, it is possible to increase the loop reach by selecting transformers with improved parameters.

Table 56 Electrical Characteristics for Supported Transformers (Magnetics)

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Turns Ratio	1:tr	0.95	1.00	1.05		±5%
Differential-to-Common-mode Rejection	DCMR	40	–	–	dB	30 MHz
		35	–	–	dB	60 MHz
		30	–	–	dB	100 MHz
Crosstalk Attenuation	CTA	45	–	–	dB	30 MHz
		40	–	–	dB	60 MHz
		35	–	–	dB	100 MHz
Insertion Loss	IL	–	–	1	dB	1 MHz ≤ f ≤ 250 MHz
Return Loss	RL	16	–	–	dB	1 MHz ≤ f ≤ 40 MHz
Return Loss	RL	16-10*log ₁₀ (f/40)	–	–	dB	40 MHz ≤ f ≤ 250 MHz

1) Also often referred to as magnetics.

7.8.3 RJ45 Plug

Table 57 describes the electrical characteristics of the RJ45 plug to be used in conjunction with MxL86289I.

Table 57 Electrical Characteristics for Supported RJ45 Plugs

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Crosstalk Attenuation	CTA	45	–	–	dB	30 MHz
		40	–	–	dB	60 MHz
		35	–	–	dB	100 MHz
Insertion Loss	IL	–	–	1	dB	1 MHz ≤ f ≤ 250 MHz
Return Loss	RL	16	–	–	dB	1 MHz ≤ f ≤ 40 MHz
Return Loss	RL	16-10*log ₁₀ (f/40)	–	–	dB	40 MHz ≤ f ≤ 250 MHz

8 Package Outline

The product is assembled in a PG-FCLBGA-256 package, which complies with regulations requiring lead free material. [Table 58](#) lists the parameters generated in accordance with JEDEC JESD51 standards [\[5\]](#).

Table 58 JEDEC Thermal Resistance Package Parameter - Compact 2-R Model Network

Item	Name/Value
Thermal Resistance - Junction to Case Top	$R_{th, JCTop} = 0.084 \text{ K/W}$
Minimum Thermal Resistance - Junction to 0 mm from package edge on PCB	$R_{th, JB} = 3.70 \text{ K/W}$

Figure 27 shows the mechanical drawings for this package. The dimensions are in millimeters.

Figure 27 PG-FCLBGA-256 13 mm x 13 mm Package Outline

9 Product Ordering Information

Table 59 provides the product ordering information.

Table 59 Product and Package Naming

Marketing Part Number	Ordering Part Number	Package	Device Number ¹⁾	Device Revision Number ²⁾	PHY Identifier ³⁾
MxL86289I	MXL86289I-ABE-R	PG-FCLBGA-256	0x14	0xC	0x554C

1) LDN field in CL22 and CL45 registers.

2) LDRN field in CL22 and CL45 registers.

3) PHY Identifier 2 register 16-bit value.

Note: For more information about part numbers, as well as the most up-to-date information and additional information on environmental rating, go to <https://www.maxlinear.com/support/product-change-notification>.
