

MxL82201 and MxL82211

16-bit I²C/SMBus GPIO Expander
Preliminary Data Sheet

General Description

The MxL82201 and MxL82211 are 16-bit GPIO expanders with an I²C/SMBus interface. After power-up, the MxL82201 has internal 100K Ω pull-up resistors on each I/O pin that can be individually enabled. The MxL82211 has the internal pull-up resistors enabled upon power-up in case it is necessary for the inputs to be in a known state.

In addition, the GPIOs on the MxL82201 and MxL82211 can individually be controlled and configured. As outputs, the GPIOs can be outputs that are high, low, or in three-state mode. The three-state mode feature is useful for applications where the power is removed from the remote devices, but they can still be connected to the GPIO expander.

As inputs, the internal pull-up resistors can be enabled or disabled and the input polarity can be inverted. The interrupt behavior is configurable. It can be set to trigger on a rising edge, falling edge, or both edges. The interrupt condition is cleared either when the input returns to its original state or when the current input state is read.

The MxL82201 and MxL82211 are enhanced versions of other 16-bit GPIO expanders with an I²C/SMBus interface. The MxL82201 is pin and software compatible with the PCA9535, TCA9535 and MAX7312.

The MxL82211 is pin and software compatible with the CAT9555, PCA9555, TCA9555, MAX7311 and MAX7318.

The MxL82201 and MxL82211 are available in 24-pin QFN and 24-pin TSSOP packages.

Applications

- Personal digital assistants (PDA)
- Cellular phones/data devices
- Battery-operated devices
- Global Positioning System (GPS)
- Bluetooth

Features

- 1.62V to 5.5V operating voltage
- 16 General purpose I/Os (GPIOs)
- Maximum stand-by current of 1 μ A at +1.8V
- I²C/SMBus bus interface
- I²C clock frequency up to 1MHz
- Noise filter on SDA and SCL inputs
- Up to 32 I²C slave addresses
- Individually programmable inputs
- Internal pull-up resistors
- Polarity inversion
- Individual interrupt enable
- Rising edge and/or falling edge interrupt
- Input filter
- Individually programmable outputs
- Output level control
- Output three-state control
- Open-drain active low interrupt output
- Pin and software compatible with PCA9535, TCA9535, MAX7312 (MxL82201)
- Pin and software compatible with CAT9555, PCA9555, TCA9555, MAX7311 and MAX7318 (MxL82211)
- 3kV HBM ESD protection per *JESD22-A114F*
- 200mA latch-up performance per *JESD7*

Specifications

Absolute Maximum Ratings

Important: The stresses above what is listed under the following table may cause permanent damage to the device. This is a stress rating only—functional operation of the device above what is listed under the following table or any other conditions beyond what MaxLinear recommends is not implied. Exposure to conditions above the recommended extended periods of time may affect device reliability.

Table 1: Absolute Maximum Ratings

Parameter	Min	Max	Units
Power Supply Voltage	-	6	V
Supply Current	-	160	mA
Ground Current	-	200	mA
External Current Limit of each GPIO	-	25	mA
Total Current Limit for GPIO[15:8] and GPIO[7:0]	-	100	mA
Total Current Limit for GPIO[15:0]	-	200	mA
Total Supply Current sourced by all GPIOs	-	160	mA

1. For I²C input signals (SDA, SCL).

2. For GPIOs, A0, A1, and A2 signals.

3. For I²C output signal SDA.

4. For GPIOs.

5. For IRQ# signal

6. Test 1: SCL frequency is 1MHz with internal pull-ups disabled. All GPIOs are configured as inputs. All inputs are steady at VCC or GND. Outputs are floating or in the tri-state mode.

7. Test 2: SCL frequency is 1MHz with internal pull-ups enabled. All GPIOs are configured as inputs. All inputs are steady at VCC or GND. Outputs are floating or in the tri-state mode.

8. Test 3: All inputs are steady at VCC or GND to minimize standby current. If internal pull-up is enabled, input voltage level should be the same as VCC. All GPIOs are configured as inputs. SCL and SDA are at VCC. Outputs are left floating or in tri-state mode.

AC Electrical Characteristics

AC Electrical characteristics at $V_{CC} = 1.62V$ to $5.5V$, $T_A = 40^{\circ}C$ to $+85^{\circ}C$, unless otherwise specified.

Table 3: AC Electrical Characteristics

Symbol	Parameter	Standard Mode I ² C-Bus		Fast Mode I ² C-Bus		Fast Mode Plus I ² C-Bus		Unit

P14	16	19	I/O	
P15	17	20	I/O	

Table 4: Pin Description (Continued)

Pin Name	QFN-24 PIN#	TSSOP-24 PIN#	Type	Description
Ancillary Signals				
VCC	21	24	Pwr	1.62V to 5.5V VCC supply voltage.
GND	9	12	Pwr	Power supply common, ground.
GND	Center Pad	-	Pwr	The exposed pad at the bottom surface of the package is designed for thermal performance. Use of a center pad on the PCB is strongly recommended for thermal conductivity as well as to provide mechanical stability of the package on the PCB. The center pad is recommended to be solder masked defined with opening size less than or equal to the exposed thermal pad on the package bottom to prevent solder bridging to the outer leads of the device. Thermal vias must be connected to GND plane as the thermal pad of package is at GND potential.

Note: Pin type: I = Input, O = Output, I/O = Input/output, OD = Output Open Drain.

Block Diagram

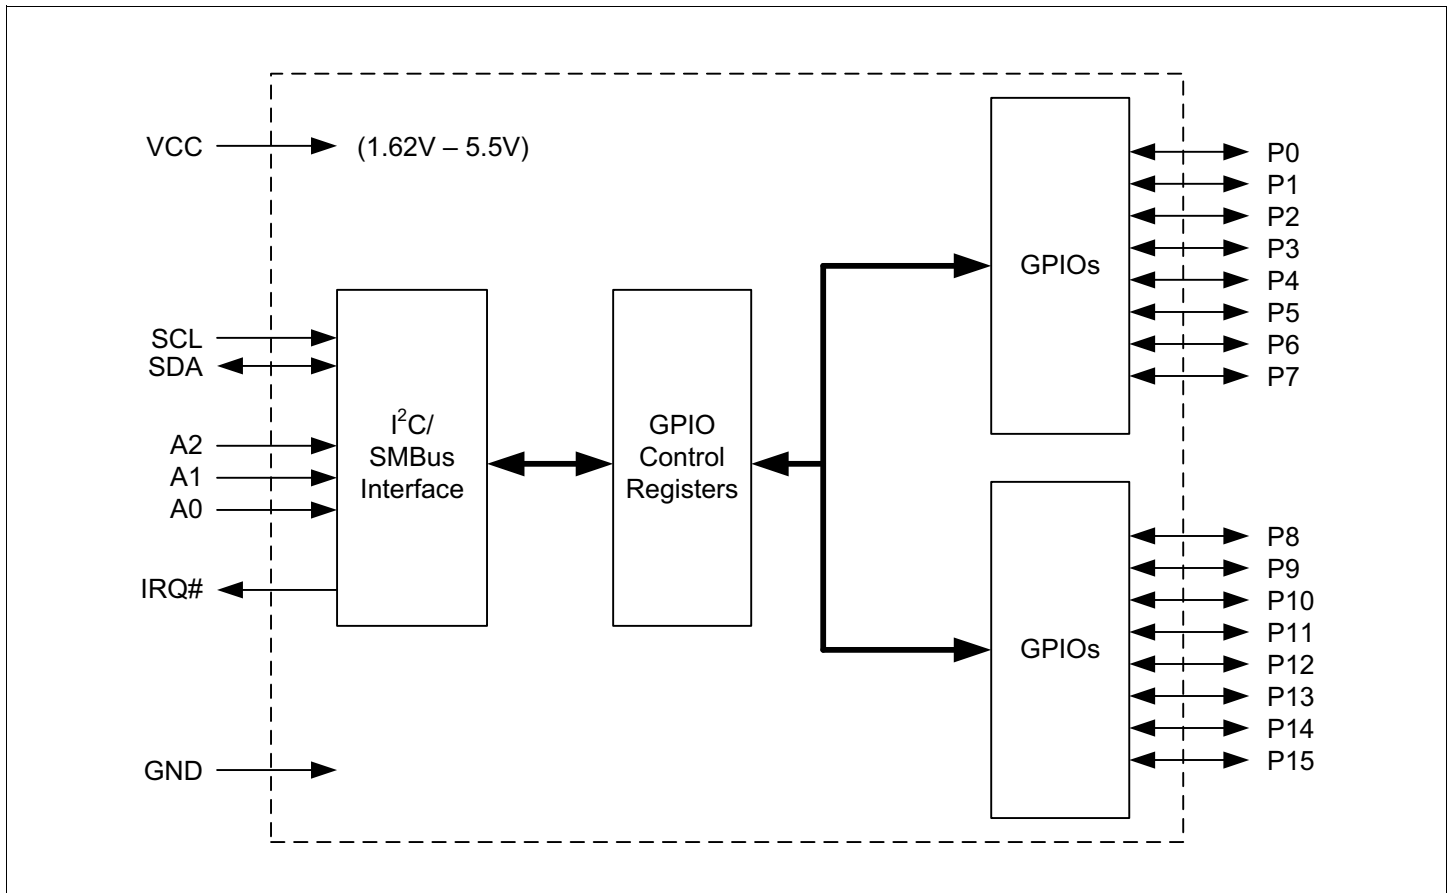

Figure 2: Functional Block Diagram

Functional Description

I²C-Bus Interface

The I²C-bus interface is compliant with the standard-mode and fast-mode I²C-bus specifications. The I²C-bus interface consists of two lines: serial data (SDA) and serial clock (SCL). In the standard-mode, the serial clock and serial data can go up to 100kbps and in the fast-mode, the serial clock and serial data can go up to 400kbps.

The first byte sent by an I²C-bus master contains a start bit (SDA transition from *high* to *low* when SCL is *high*), a 7-bit slave address, and whether it is a read or write transaction. The next byte is the sub-address that contains the address of the register to access. The MxL82201 and MxL82211 respond to each write with an acknowledge (SDA driven *low* by MxL82201/MxL82211 for one clock cycle when SCL is *high*). The last byte sent by an I²C-bus master contains a stop bit (SDA transition from *low* to *high* when SCL is *high*). See the following figures. For complete details, refer to the I²C-bus specifications.

Figure 3: I²C Start and Stop Conditions

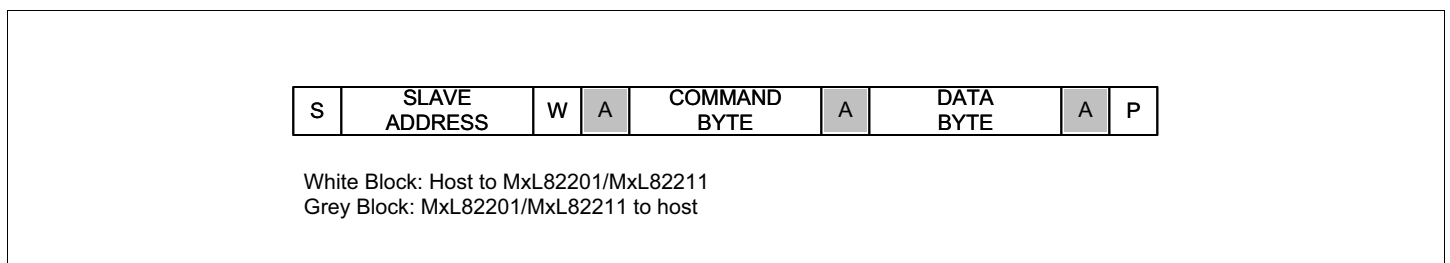

Figure 4: Master Writes To Slave

Figure 5: Master Reads From Slave

I²C-Bus Addressing

There can be different devices on the I²C-bus. To distinguish itself from the other devices on the I²C-bus, the MxL82201 and MxL82211 have up to 32 I²C slave addresses using the A2-A0 address lines. The following table lists the different addresses that can be selected.

Table 5: I²C Address Map

A2	A1	A0	I ² C Address
GND	SCL	GND	0x20 (0010 000X)
GND	SCL	VCC	0x22 (0010 001X)
GND	SDA	GND	0x24 (0010 010X)
GND	SDA	VCC	0x26 (0010 011X)
VCC	SCL	GND	0x28 (0010 100X)
VCC	SCL	VCC	0x2A (0010 101X)
VCC	SDA	GND	0x2C (0010 110X)
VCC	SDA	VCC	0x2E (0010 111X)
GND	SCL	SCL	0x30 (0011 000X)
GND	SCL	SDA	0x32 (0011 001X)
GND	SDA	SCL	0x34 (0011 010X)
GND	SDA	SDA	0x36 (0011 011X)
VCC	SCL	SCL	0x38 (0011 100X)
VCC	SCL	SDA	0x3A (0011 101X)
VCC	SDA	SCL	0x3C (0011 110X)
VCC	SDA	SDA	0x3E (0011 111X)
GND	GND	GND	0x40 (0100 000X)
GND	GND	VCC	0x42 (0100 001X)
GND	VCC	GND	0x44 (0100 010X)
GND	VCC	VCC	0x46 (0100 011X)
VCC	GND	GND	0x48 (0100 100X)
VCC	GND	VCC	0x4A (0100 101X)
VCC	VCC	GND	0x4C (0100 110X)
VCC	VCC	VCC	0x4E (0100 111X)
GND	GND	SCL	0x50 (0101 000X)
GND	GND	SDA	0x52 (0101 001X)
GND	VCC	SCL	0x54 (0101 010X)
GND	VCC	SDA	0x56 (0101 011X)
VCC	GND	SCL	0x58 (0101 100X)
VCC	GND	SDA	0x5A (0101 101X)
VCC	VCC	SCL	0x5C (0101 110X)
VCC	VCC	SDA	0x5E (0101 111X)

I²C Read and Write

A read or write transaction is determined by bit-0 of the slave address. If bit-0 is 0, then it is a write transaction. If bit-0 is 1, then it is a read transaction.

I²C Command Byte

An I²C command byte is sent by the I²C master following the slave address. The command byte indicates the address offset of the register that is accessed. The following table lists the command bytes for each register.

Table 6: I²C Command Byte (Register Address)

Command Byte	Register Name Description	Read/Write	Default Values
0x00	GSR1—GPIO State for P0-P7	Read-Only	0xFF
0x01	GSR2—GPIO State for P8-P15	Read-Only	0xFF
0x02	OCR1—Output Control for P0-P7	Read/Write	0xFF
0x03	OCR2—Output Control for P8-P15	Read/Write	0xFF

0x0A	IER1—Input Interrupt Enable for P0-P7	Read/Write	0x00
0x0B	IER2—Input Interrupt Enable for P8-P15	Read/Write	0x00
0x0C	TSCR1—Output Three-State Control for P0-P7	Read/Write	0x00
0x0D	TSCR2—Output Three-State Control for P8-P15	Read/Write	0x00
0x0E	ISR1—Input Interrupt Status for P0-P7	Read	0x00
0x0F	ISR2—Input Interrupt Status for P8-P15	Read	0x00
0x10	REIR1—Input Rising Edge Interrupt Enable for P0-P7	Read/Write	0x00
0x11	REIR2—Input Rising Edge Interrupt Enable for P8-P15	Read/Write	0x00
0x12	FEIR1—Input Falling Edge Interrupt Enable for P0-P7	Read/Write	0x00
0x13	FEIR2—Input Falling Edge Interrupt Enable for P8-P15	Read/Write	0x00
0x14	IFR1—Input Filter Enable/Disable for P0-P7	Read/Write	0xFF
0x15	IFR2—Input Filter Enable/Disable for P8-P15	Read/Write	0xFF

Interrupts

The following table lists the interrupt behavior of the different register settings for the MxL82201 and MxL82211.

Table 7: Interrupt Generation and Clearing

GCR Bit	IER Bit	REIR Bit	FEIR Bit	IFR Bit	Interrupt Generated By	Interrupt Cleared By
1	0	X	X	X	No interrupts enabled (default).	N/A.
1	1	0	0	0	A rising or falling edge on the input.	Reading the GSR register or if the input changes back to its previous state (state of input during last read to GSR).
				1	A rising or falling edge on the input and remains in the new state for more than 1075ns.	
1	1	1	0	0	A rising edge on the input.	Reading the GSR register.
				1	A rising edge on the input and remains high for more than 1075ns.	
1	1	0	1	0	A falling edge on the input.	Reading the GSR register.
				1	A falling edge on the input and remains low for more than 1075ns.	
1	1	1	1	0	A rising or falling edge on the input.	Reading the GSR register.
				1	A rising or falling edge on the input and remains in the new state for more than 1075ns.	
0	x	x	x	x	No interrupts in output mode.	N/A

Register Description

GPIO State Register 1 (GSR1)—Read Only

The status of P7–P0 can be read via this register. A read shows the current state of these pins (or the inverted state of these pins if enabled via the PIR register). Reading this register clears an input interrupt (For complete details, see [Table 7](#) on page 10). Reading this register also returns the last value written to the OCR register for any pins that are configured as outputs (that is, this is not the same as the state of the actual output pin since the output pin can be in three-state mode). A write to this register has no effect. The MSB of this register corresponds with P7 and the LSB of this register corresponds with P0.

GPIO State Register 2 (GSR2)—Read Only

The status of P15–P8 can be read via this register. A read shows the current state of these pins (or the inverted state of these pins if enabled via the PIR register). Reading this register clears an input interrupt (For complete details, see [Table 7](#) on page 10). Reading this register also returns the last value written to the OCR register for any pins that are configured as outputs (that is, this is not the same as the state of the actual output pin since the output pin can be in three-state mode). A write to this register has no effect. The MSB of this register corresponds with P15 and the LSB of this register corresponds with P8.

Output Control Register 1 (OCR1)—Read/Write

When P7–P0 are defined as outputs, they can be controlled by writing to this register. Reading this register returns the last value written to it, however, this value may not be the actual state of the output pin since these pins can be in three-state mode. The MSB of this register corresponds with P7 and the LSB of this register corresponds with P0.

Output Control Register 2 (OCR2)—Read/Write

When P15–P8 are defined as outputs, they can be controlled by writing to this register. Reading this register returns the last value written to it, however, this value may not be the actual state of the output pin since these pins can be in three-state mode. The MSB of this register corresponds with P15 and the LSB of this register corresponds with P8.

Input Polarity Inversion Register 1 (PIR1)—Read/Write

When P7–P0 are defined as inputs, this register inverts the polarity of the input value read from the input port register. If the corresponding bit in this register is set to *1*, the value of this bit in the GSR register is the inverted value of the input pin. If the corresponding bit in this register is set to *0*, the value of this bit in the GSR register is the actual value of the input pin. The MSB of this register corresponds with P7 and the LSB of this register corresponds with P0.

Input Polarity Inversion Register 2 (PIR2)—Read/Write

When P15–P8 are defined as inputs, this register inverts the polarity of the input value read from the input port register. If the corresponding bit in this register is set to *1*, the value of this bit in the GSR register is the inverted value of the input pin. If the corresponding bit in this register is set to *0*, the value of this bit in the GSR register is the actual value of the input pin. The MSB of this register corresponds with P15 and the LSB of this register corresponds with P8.

GPIO Configuration Register 1 (GCR1)—Read/Write

This register configures the GPIOs as inputs or outputs. After power-up, the GPIOs are inputs. Setting these bits to *0* enables the GPIOs as outputs. Setting these bits to *1* enables the GPIOs as inputs. The MSB of this register corresponds with P7 and the LSB of this register corresponds with P0.

GPIO Configuration Register 2 (GCR2)—Read/Write

This register configures the GPIOs as inputs or outputs. After power-up, the GPIOs are inputs. Setting these bits to *0* enables the GPIOs as outputs. Setting these bits to *1* enables the GPIOs as inputs. The MSB of this register corresponds with P15 and the LSB of this register corresponds with P8.

Input Internal Pull-up Enable/Disable Register 1 (PUR1)—Read/Write

This register enables/disables the internal pull-up resistors for an input. After power-up, the internal pull-up resistors are disabled for the MxL82201. Writing a *1* to these bits enables the internal pull-up resistors. After power-up, the internal pull-up resistors are enabled for the MxL82211. Writing a *0* to these bits disables the internal pull-up resistors. The MSB of this register corresponds with P7 and the LSB of this register corresponds with P0.

Input Internal Pull-up Enable/Disable Register 2 (PUR2)—Read/Write

This register enables/disables the internal pull-up resistors for an input. After power-up, the internal pull-up resistors are disabled for the MxL82201. Writing a *1* to these bits enables the internal pull-up resistors. After power-up, the internal pull-up resistors are enabled for the MxL82211. Writing a *0* to these bits disables the internal pull-up resistors. The MSB of this register corresponds with P15 and the LSB of this register corresponds with P8.

Input Interrupt Enable Register 1 (IER1)—Read/Write

This register enables/disables the interrupts for an input. After power-up, the interrupts are disabled. Writing a *1* to these bits enables the interrupt for the corresponding input pins. For complete details of the interrupt behavior for various register settings, see [Table 7](#) on page 10. No interrupts are generated for outputs when GCR bit is *0*. The MSB of this register corresponds with P7 and the LSB of this register corresponds with P0.

Input Interrupt Enable Register 2 (IER2)—Read/Write

This register enables/disables the interrupts for an input. After power-up, the interrupts are disabled. Writing a *1* to these bits enables the interrupt for the corresponding input pins. For complete details of the interrupt behavior for various register settings, see [Table 7](#) on page 10. No interrupts are generated for outputs when GCR bit is *0*. The MSB of this register corresponds with P15 and the LSB of this register corresponds with P8.

Output Three-State Control Register 1 (TSCR1)—Read/Write

This register can enable/disable the three-state mode of an output. Writing a *1* to these bits enables the three-state mode for the corresponding output pins. The MSB of this register corresponds with P7 and the LSB of this register corresponds with P0.

Output Three-State Control Register 2 (TSCR2)—Read/Write

This register can enable/disable the three-state mode of an output. Writing a 1 to these bits enables the three-state mode for the corresponding output pins. The MSB of this register corresponds with P15 and the LSB of this register corresponds with P8.

Input Interrupt Status Register 1 (ISR1)—Read Only

This register reports the input pins that have generated an interrupt. For complete details of the interrupt behavior for various register settings, see [Table 7](#) on page 10. The MSB of this register corresponds with P7 and the LSB of this register corresponds with P0.

Input Interrupt Status Register 2 (ISR2) - Read-Only

This register reports the input pins that have generated an interrupt. For complete details of the interrupt behavior for various register settings, see [Table 7](#) on page 10. The MSB of this register corresponds with P15 and the LSB of this register corresponds with P8.

Input Rising Edge Interrupt Enable Register 1 (REIR1) - Read/Write

Writing a 1 to these bits enables the corresponding input to generate an interrupt on the rising edge. For complete details of the interrupt behavior for various register settings, see [Table 7](#) on page 10. The MSB of this register corresponds with P7 and the LSB of this register corresponds with P0.

Input Rising Edge Interrupt Enable Register 2 (REIR2) - Read/Write

Writing a 1 to these bits enables the corresponding input to generate an interrupt on the rising edge. For complete details of the interrupt behavior for various register settings, see [Table 7](#) on page 10. The MSB of this register corresponds with P15 and the LSB of this register corresponds with P8.

Input Falling Edge Interrupt Enable Register 1 (FEIR1) - Read/Write

Writing a 1 to these bits enables the corresponding input to generate an interrupt on the falling edge. Writing a 1 to these bits makes that input generate an interrupt on the rising edge only. For complete details of the interrupt behavior for various register settings, see [Table 7](#) on page 10. The MSB of this register corresponds with P7 and the LSB of this register corresponds with P0.

Input Falling Edge Interrupt Enable Register 2 (FEIR2) - Read/Write

Writing a 1 to these bits enables the corresponding input to generate an interrupt on the falling edge. Writing a 1 to these bits makes that input generate an interrupt on the rising edge only. For complete details of the interrupt behavior for various register settings, see [Table 7](#) on page 10. The MSB of this register corresponds with P15 and the LSB of this register corresponds with P8.

Input Filter Enable Register 1 (IFR1) - Read/Write

By default, the input filters are enabled (IFR = 0xFF). When the input filters are enabled, any pulse that is greater than 1075ns generates an interrupt (if enabled). Pulses that are less than 225ns is filtered and do not generate an interrupt. Pulses in between this range may or may not generate an interrupt. Writing a 0 to these bits disables the input filter for the corresponding inputs. With the input filters disabled, any change on the inputs generates an interrupt (if enabled). For complete details of the interrupt behavior for various register settings, For complete details, see [Table 7](#) on page 10. The MSB of this register corresponds with P7 and the LSB of this register corresponds with P0.

Input Filter Enable Register 2 (IFR2) - Read/Write

By default, the input filters are enabled (IFR = 0xFF). When the input filters are enabled, any pulse that is greater than 1075ns generates an interrupt (if enabled). Pulses that are less than 225ns is filtered and is not generated an interrupt. Pulses in between this range may or may not generate an interrupt. Writing a 0 to these bits disables the input filter for the corresponding inputs. With the input filters disabled, any change on the inputs generates an interrupt (if enabled). For complete details of the interrupt behavior for various register settings, see [Table 7](#) on page 10. The MSB of this register corresponds with P15 and the LSB of this register corresponds with P8.
